Exam 4, Monday, April 14

Review sheet posted this afternoon

Review Thursday, April 10 by Jacob, 5:00 PM, RLM 7.104

Wheeler expanded office hours, afternoon, Friday, April 11

Reading for Exam 4: Chapter 8 - Sections 8.1, 8.2, 8.5, 8.6, 8.10; Chapter 9 – Sections 9.1 - 9.5 (NOTE not all of Chapter 9).

Astronomy in the news:

Update on new "nearby" supernova SN 2014J in M82

Nothing to Report

Lots of papers in preparation

Goals:

To understand how Einstein taught us to think about space, time, and gravity.

To understand what we mean by space.

To understand how space can be curved.

Geometry on the 2D surface of the balloon

Exercises of drawing straight lines

Route from JFK airport to Paris Orly.

Is this a straight line?

Balloon

Surface is curved 2 D space

3 D space around the balloon, inside the balloon is *hyperspace* with respect to the 2D surface

Imagine a 2 D creature that can only perceive 2 D space.

2 D creatures can learn all about the curvature of the space they inhabit by doing geometry in 2 D - they never need to know about or care about "hyperspace."

That's us in 3 D! There might be 4D (or higher!) hyperspace around us, but we don't perceive it.

We can, in principle, learn everything we need to know about our 3D Universe by doing 3D observations and experiments in the confines of our own dimensionality, just as 2D creatures could learn of their universe, the surface of the balloon.

What you need to know about the surface of the balloon -

What is a straight line, what is not?

What is "inside" the surface? What is "outside" the surface Where is the "center" of the **surface**?

What does it mean to go from surface point to surface point "through" the balloon interior?

How do you determine the shape of the surface by doing geometry?

Real 3 D curved space (for us!!) might curve in a 4 D "hyperspace," but we do not directly perceive that hyperspace.

We can determine the curvature, shape of our real 3 D space by doing 3 D geometry.

Do not need to ask about 4 D (but will!)

Can 3-dimensional space be "flat?"

Yes, it can be flat or curved, just as 2-dimensional space can.

3-dimensional space is regarded as flat if the result of doing geometry is the same as ordinary flat two dimensional space, the sum of interior angles of triangles is 180 degrees, parallel lines remain parallel.

If flat space geometry does not apply, the space is curved, or non-Euclidian.

Can 4-dimensional space be flat?

One Minute Exam

In a curved space:

Straight lines always connect to themselves

Straight lines are the shortest distance between two points

There are no straight lines

L

The sum of the interior angles of a triangle is 180 degrees

One Minute Exam

Compared to the two-dimensional surface of a balloon, the inside of the balloon is:

A three-dimensional hyperspace

A four-dimensional hyperspace

Accessible to a two-dimensional creature

One Minute Exam

- An intelligent ant crawls around on a surface, drawing triangles as the intersection of 3 straight lines. She finds that the sum of the interior angles is always more than 180 degrees and that triangles of the same size always give the same results. She deduces that the following will be true:
 - If she draws two straight lines that are initially parallel they will begin to diverge.
 - The surface she is walking on is three-dimensional
 - If she walks off in a straight line she will never return to her point of origin
 - If she walks off in a straight line she will return to her point of origin

Goal:

To understand the nature of curved space, and hence of gravity, in the vicinity of a massive object, a planet, star, or black hole.

To understand the role of an "embedding diagram" in helping to explain that curved space.

Embedding diagram:

- Real Space -> Embedding Diagram Space
- Volume (3D) -> Surface (2D)
- Surface (2D) -> Line (1D)
- Line (1D) -> Point (0D)

Invert balloon - 2 D embedding diagram of curved 3 D space around gravitating object

Properties of this curved space that are preserved in the embedding diagram:

 $C < 2\pi r$

Sum of angles of triangle not equal 180° (can be > or <)

Parallel lines diverge or cross

```
Orbits around "cone"
```

Far from a gravitating object, the curvature and hence gravity, gets very weak, 3D space becomes FLAT, and the corresponding embedding diagram is a flat 2D plane (can't show this with the balloon).
