Communication, 2.

Search Strategies

- Basic Problem: where to look?
- Possible Scenarios
 - Powerful, omnidirectional beacons
 - Implies very advanced civilization
 - Seeking to attract attention of new civilizations
 - Nearby, not so advanced, broadcasting to us
 - Unlikely
 - Detect leakage radiation

Leakage Radiation

Various sources

– TV, radio, ...

- Repeatable pattern due to Earth rotation
- Switch to digital TV in June 2009
 - Some changes, but similar frequencies used
- Defense radars
 - Most powerful, but won't repeat

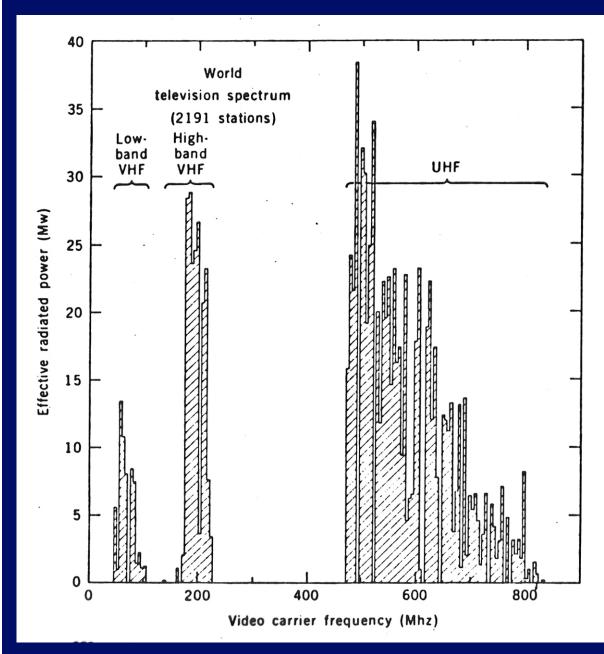

TABLE 20-1

ESTIMATED POWER OUTPUT OF	VARIOUS RADIO-PHOTON SOURCES THAT	OPERATE AT FREQUENCIES	GREATER THAN 20 MHZ
---------------------------	-----------------------------------	------------------------	---------------------

	Frequency Range (MHz)	Number of Transmitters	Fraction of Time that Transmitters Emit	Per Individual Transmitter		
Source				Maximum Power Radiated (watts)	Effective Frequency Bandwidth (hertz)	Total Average Power Radiated (watts per hertz of bandwidth)ª
Citizen-band radios	27	10,000,000	1/100	5	2	200,000
Professional landmobile radios	20–500	100,000	1/10	20	1	200,000
Weather, marine, and air radars	1000-10,000	100,000	1/100	10,000 to 1,000,000	1,000,000	10 to 1000
Defense radars ^b	400	2	1/10	10,000,000,000	0.1	20,000,000,000
FM radio stations	88-108	10,000	1 .	4000	0.1	400,000,000
TV stations (for photons that carry picture, not sound)	40850	2000	1	500,000	0.1	10,000,000,000

^aThe last column shows the power radiated *per hertz of bandwidth*. Systems that cover a wider bandwidth (most noticeably, weather, marine, and air radars) will radiate a greater total power over *all* frequencies than this column would suggest. This table, as well as Figures 20-7, 20-8, and 20-9 follow the results of a study made by W. Sullivan III, S. Brown, and C. Wetherill in *Science*, vol. 199, p. 377, 1978.

^bWe have considered only the most powerful defense radars; these dominate the total power output from all such radar systems.

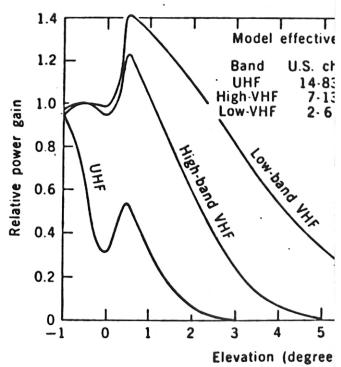

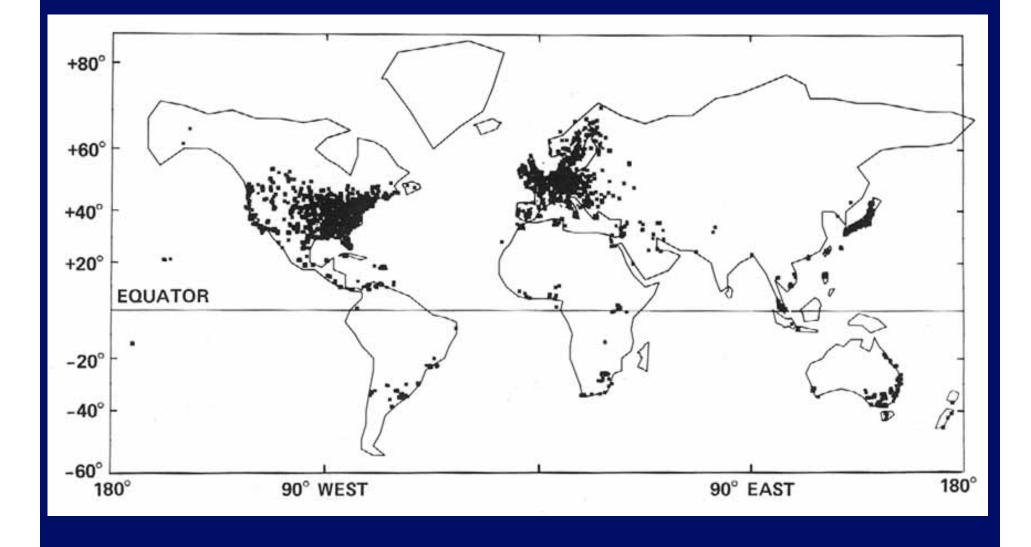

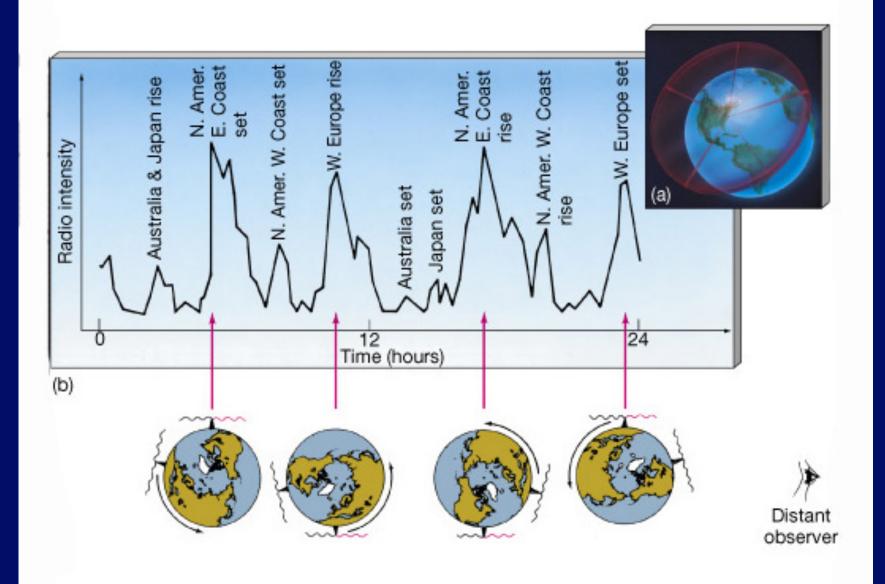

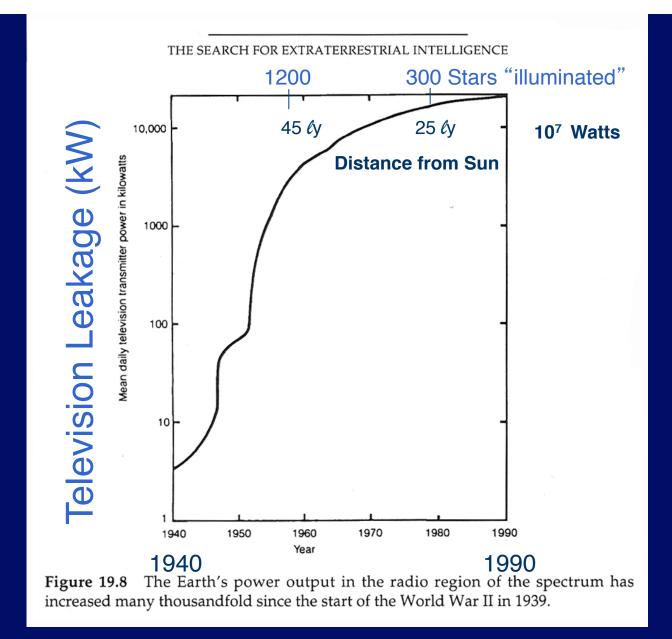

Fig. 3 (left). World television spectrum, show which the most power is radiated (5-Mhz-v primary bands (channels 2 to 6, 7 to 13, and States) are also indicated. A distant extrater a frequency resolution of 5 Mhz would at n spectrum roughly of this shape. Fig. 4 tenna power patterns adopted in the model television frequency bands. The radiation is s to the local horizon of each transmitter and directional in azimuth.

World Television Transmitters

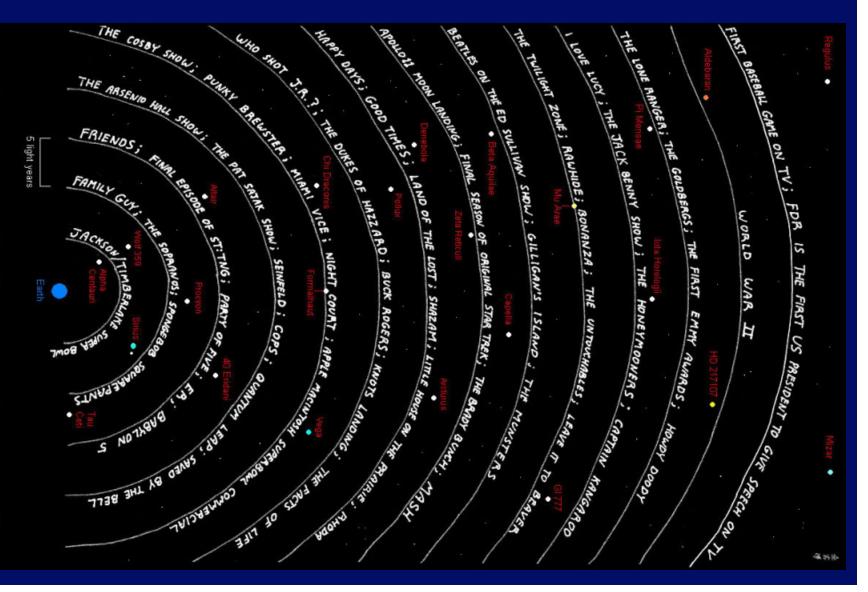

By 2016, 75 ly, 3400 stars for earliest TV 56 ly, 1800 stars for 1960 transmissions

What are they watching???

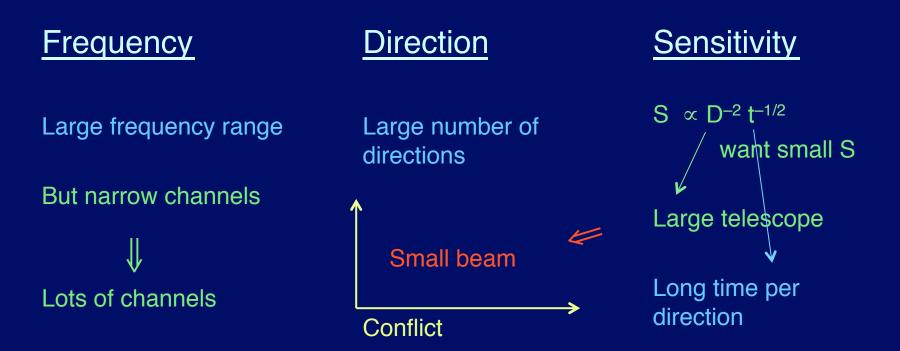

broadcasts, then this is what they are currently watching If extraterrestrial civilizations are monitoring our TV

Word of the Day: Haystack

- Literally, a stack of hay
- Saying: "looking for a needle in a haystack"
- Metaphor: the cosmic haystack

The Cosmic Haystack

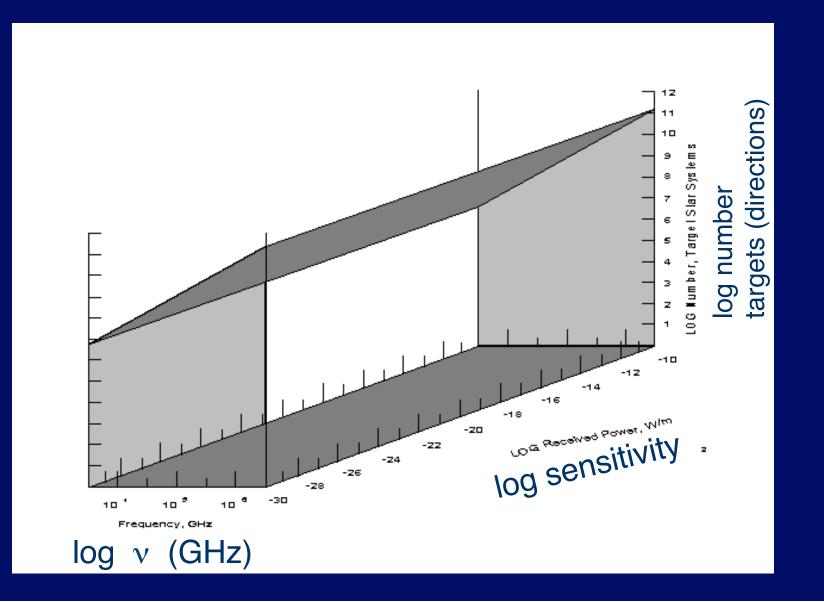

Strong signals, unknown origin

 \Rightarrow Small telescope, short t, cover sky

Weak signals, nearby stars

 \Rightarrow Large telescope, longer t, only stars

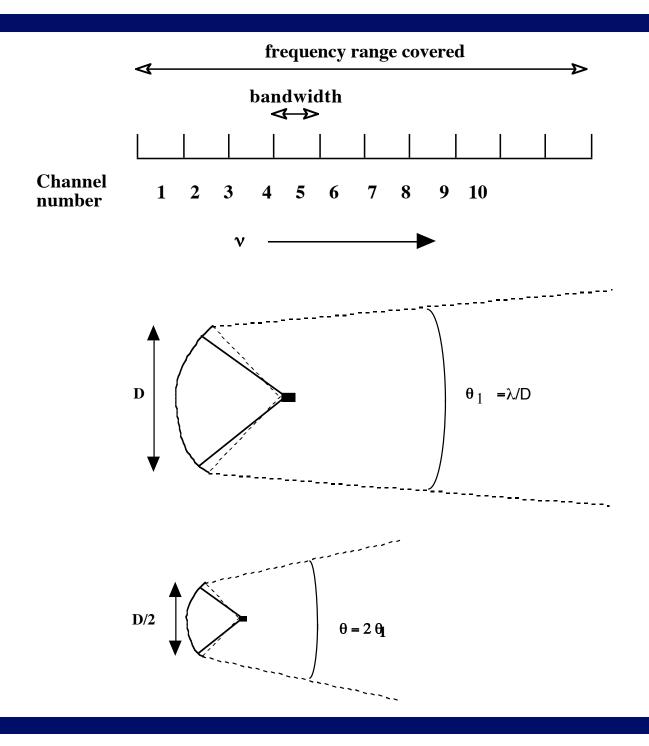

Cosmic Haystack

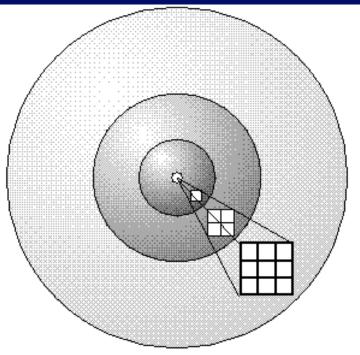

Sensitivity

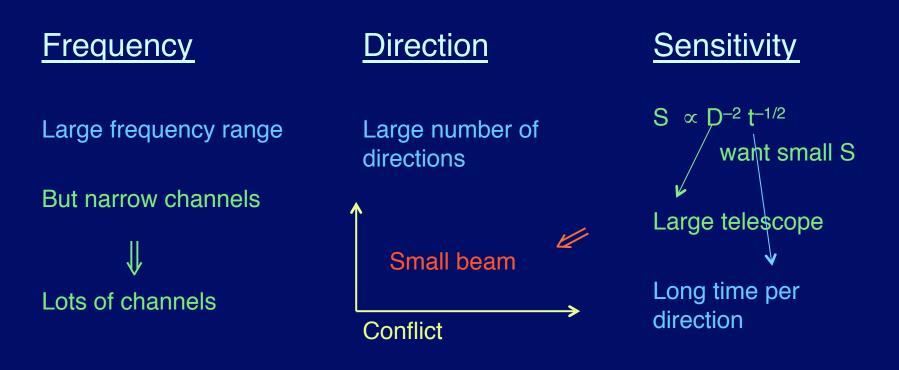

Light spreads out with the **square** of the distance. Through a sphere twice as large, the energy covers an area **four** times larger. Through a sphere three times as large, the energy covers an area **nine** times larger.

Signal per area \propto distance⁻²

Sensitivity (S): How weak a signal can I detect? The bigger the collecting area (\propto D²), the weaker the signal I can detect (S \propto D⁻²). The longer I average, the weaker the signal, but only S \propto t^{-0.5} Summary: $S \propto D^{-2}t^{-0.5}$

HR 5158

EXCERPTS REGARDING SETI

101st Congress of the United States, 2nd Session

From Senate Report 101-474, to accompany H.R. 5158, from the Departments of Veterans Affairs, HUD and Independent Agencies Appropriation Bill, 1991, dated September 16, 1990 (Senator Barbara Mikuski--chair):

Regarding the NASA budget:

"...For life sciences, the Committee recommends the following:

-\$25,000,000 from the \$168,000,000 requested for life sciences, to be taken as a general reduction, subject to the normal reprogramming guidelines. None of this reduction is to be taken from the request for the search for extraterrestrial intelligence (SETI) program.

"In recommending the full budget request of \$12,100,000 for the SETI program, the Committee reaffirms its support of the basic scientific merit of this experiment to monitor portions of the radio spectrum as an efficient means of exploring the possibility of the existence of intelligent extraterrestrial life. While this speculative venture stimulates widespread interest and imagination, the Committee's recommendation is based on its assessment of the technical and engineering advances associated with the development of the monitoring devices needed for the project and on the broad educational component of the program. The fundamental character of the SETI program provides unique opportunities to explain principles of such scientific disciplines as biology, astronomy, physics, and chemistry, in addition to exposing students to the development and application of microelectronic technology.

"The Committee has included the full request of \$2,000,000 for the Lifesat project..."

\$14.5 MILLION FY92

From the Joint House-Senate Conference Report for Veterans Affairs: HUD and Independent Agencies (approved on October 17, 1990):

Regarding the NASA budget:

"...- \$25,000 from Life Sciences

"The Conferees agree that within the balance of funds available in this action, \$12,100,000 shall be allocated to the Search for Extraterrestrial Intelligence and \$2,000,000 for Lifesat..."

Congress may hang up on research of E.T.s

Extraterrestrials won't be able to phone home if there's nobody on earth to take the call

By Keey Davidson New York Times News Service

SAN FRANCISCO — Who killed E.T.?

An effort by the National Aeronautics and Space Administration effort to detect signals from extraterrestrials has been axed by Congress.

Experts blame everything from its "giggle factor" to poor salesmanship to Congress' unwillingness to cut politically stronger programs.

Hollywood has made big money from fictional extraterrestrials, and they clutter TV shows and grocery-store tabloids.

But NASA's \$104 million attempt to find real aliens — the Mountain View, Calif., High Resolution Microwave Survey — was too costly for a joint congressional committee. It agreed to end the program just one year into its planned 10-year search. The program is popularly known by its previous name, Search for Extraterrestrial Intelligence, or SETI.

"I'm pretty depressed " said Pa-

Critics accuse Congress of making SETI a sacrificial lamb after failing to kill two programs — the oft-maligned space station and the \$3 billion Advanced Solid Rocket Motor, which *Reader's* Digest last year called "the unstoppable porkbooster." It's based in Yellow Creek, Miss., home to Democratic Rep. Jamie Whitten, who until last year chaired the House Appropriations Committee.

Project staff members took pride in the program's size. "Each space shuttle launch has been estimated to cost as much as \$1 billion. That's a century worth of SETI research," said Seth Shostak of the quasi-private SETI Institute in Mountain View.

But politically, "the SETI people made a fundamental mistake — stupid, stupid, stupid! — in the way they've been lobbying for their programs," said John Pike, a policy expert with the Federation of American Scientists in Washington. "SETI is one of the things that is most readily understood and widely appreciated by the public.

Ralph De Gennaro, a senior budget analyst for Friends of the Earth in Washington, D.C., shed no tears for SETL.

"I'm sick and tired of being told that we can't afford to save this planet but we do have enough money to listen to aliens on other

Project Phoenix 1998-2004

SETI Institute (- minus NASA \$\$) Private Funding (Packard of HP) Relocated to Australia 64 - m telescope
Used various other telescopes, including Arecibo
1.2 - 3.0 GHz , 28 × 10⁶ channels, 1 Hz channel width
Targeted search: 850 nearby stars within 240 *ky* Sensitivity ~ 1 × 10⁻²⁶ W m⁻²
Could detect 1 Mega Watt <u>if</u> beamed to us by similar size telescope

Used a second telescope to discriminate against interference No civilizations found

Allen Telescope Array (ATA) SETI Institute, UC Berkeley Major telescope dedicated to SETI Partially constructed, some operations (2006) Cost ~ 26 M \$ ~ 1/2 provided by Paul Allen, Nathan Myrvold (Microsoft) Hat Creek, California 350 × 6 m antennas 1 - 10 GHz

Began operation with 42 telescopes in Oct. 2007

Allen Telescope Array (ATA)

First major telescope designed for searching for signals from other civilizations. Initial funds from Paul Allen (Microsoft)

Goals for Allen Telescope Array

Survey 1,000,000 stars for non-natural extraterrestrial signals with enough sensitivity to detect the equivalent power of the Arecibo radar out to 1000 light-years within the frequency range of 1 to 10 GHz

Survey the 4×10^{10} stars of the inner Galactic Plane in the "water hole" frequency range from 1420 MHz to 1720 MHz for very powerful, non-natural transmitters

Was not completed. They need funding for more antennas. Now operated by SRI, got some funds from tech entrepreneur, still seeking more.

Expanding the Search Radius

Allen Telescope Arrow Project Proen

Comparison of the Allen Telescope Array and Project Phoenix

Searches with Visible Light

For pulsed signals, visible light from lasers. Some advantages. Can concentrate light in narrow band, short pulses to distinguish from star light. They have to be beamed toward us.

Optical SETI at Harvard: 1.5-m telescope 4 x 10⁻⁹ W m⁻² in nanosecond pulses Plan to observe 13000 stars. Also a northern sky survey.

Optical SETI in California 1-m telescope Multiple detectors to avoid false signals.

Leakage Radiation with Visible Light

- Hard because stars emit visible light
 - But fluorescent/LEDs have different spectra
 - Could detect major city light from object in outer solar system
 - Maybe later around other stars with much bigger telescopes
 - Loeb and Turner, 2012

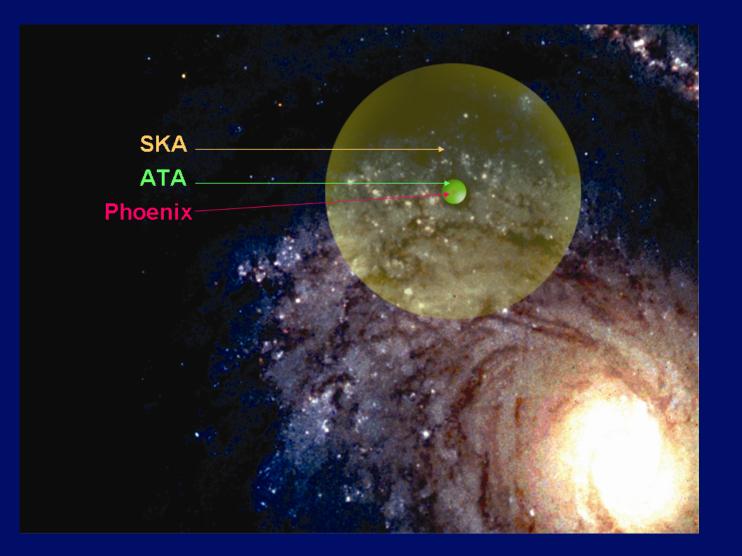

"Leakage" Radiation in Infrared

- Kardashev classified Very advanced civs.
 - Type 1 all solar energy on planet
 - Type 2 all energy of star
 - Dyson sphere (emits in infrared)
 - Type 3 all energy of galaxy
 - Should have huge infrared excess around 10-20
 micrometers wavelength
 - Recent Search: none with more that 85%
 - All probably starbursts, but some unusual ones
 - Griffith et al. 2015

Future Dreams

- Square Kilometer Array (SKA)
 - Use many smaller units
 - Total area about 1 square km
 - Similar to, but beyond, "Argus" in Contact
 - Probably will be three separate arrays
 - To cover full range: 100 MHz to 50 GHz
 - Two decided, one in Australia, one in South Africa

Square Kilometer Array (SKA)

Breakthrough Listen

- Yuri Milner, Mark Zuckerberg, Stephen Hawking
- Committed 100 M\$ over 10 years in Aug, 2015
- Buy time on large radio telescopes
- Also optical searches
- 100 million stars, Galactic Plane, 100 closest galaxies
- Multibeam receivers in Australia
- http://breakthroughinitiatives.org/Initiative/1
