Life in the Outer Solar System

Jupiter

Big $R = 11R_{\oplus}$

Massive $M = 300 M_{\oplus}$

= 2.5 all the rest

Mostly H₂, He Thick Atmosphere But also more complex molecules Colors, storms

Like Miller - Urey

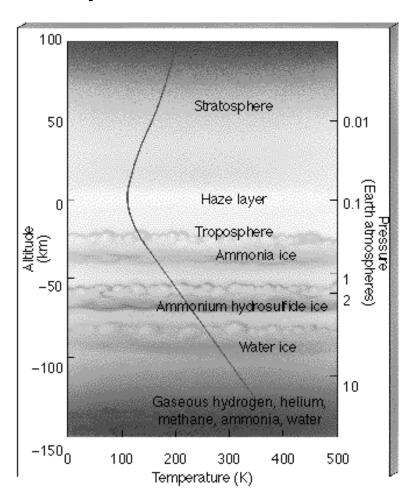

Life in Jupiter Atmosphere?

Sagan-Salpeter, etc.

Sinkers (Plankton)

Floaters (Fish)

Hunters (Fish)

Galileo Results on Jupiter

Reached Jupiter Dec. 1995 Sent probe into Jupiter's atmosphere at 100,000 mile/hour Decelerated at 230 g Lasted for 57 min.

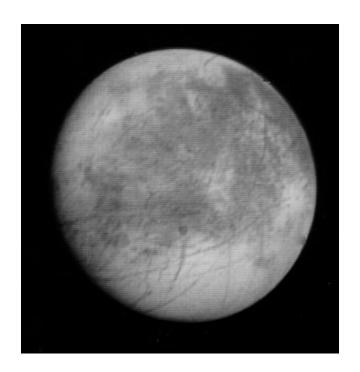

Found: Strong winds

Turbulence, little lightning

Surprise: Little or no H₂O May have entered in an unusual place (fewer clouds)

Life less likely?

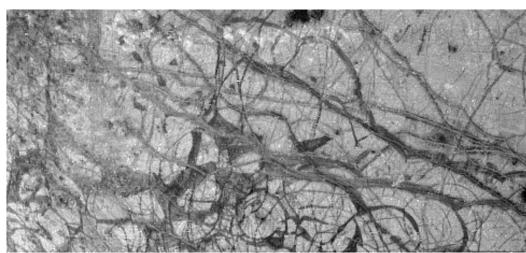

Europa (Moon of Jupiter)

Surface: Fractured Ice

Subsurface Oceans?

(Heated from Inside)

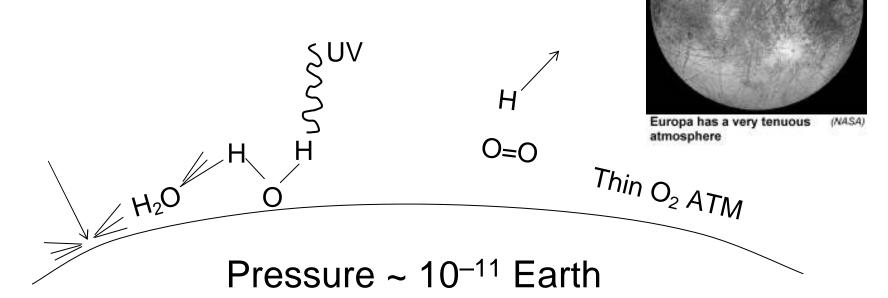

Close-up of "ice floes"

Galileo - Jupiter's Moons

http://www.jpl.nasa.gov/galileo/index.html

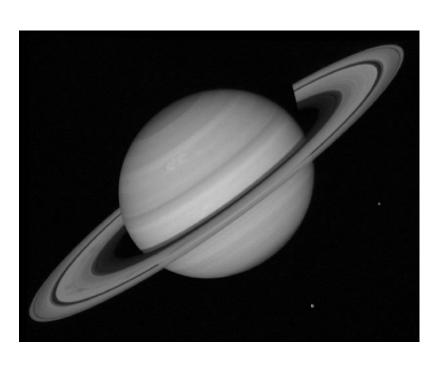

Europa has a (THIN!) atmosphere

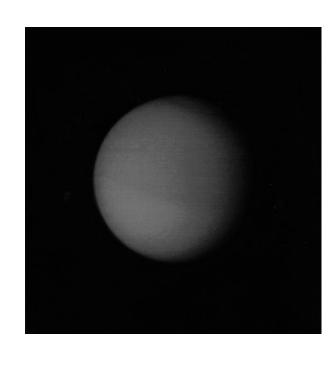

More evidence for resurfacing along cracks by "ice geysers" ———— fluid ice or liquid water

Organic molecules on Callisto & Ganymede, maybe Europa?

Saturn

- Big (9.4 R⊕)
- Massive (95 M⊕)
- Year 29.5 years
- Day 0.43 days
- Composition similar to Jupiter

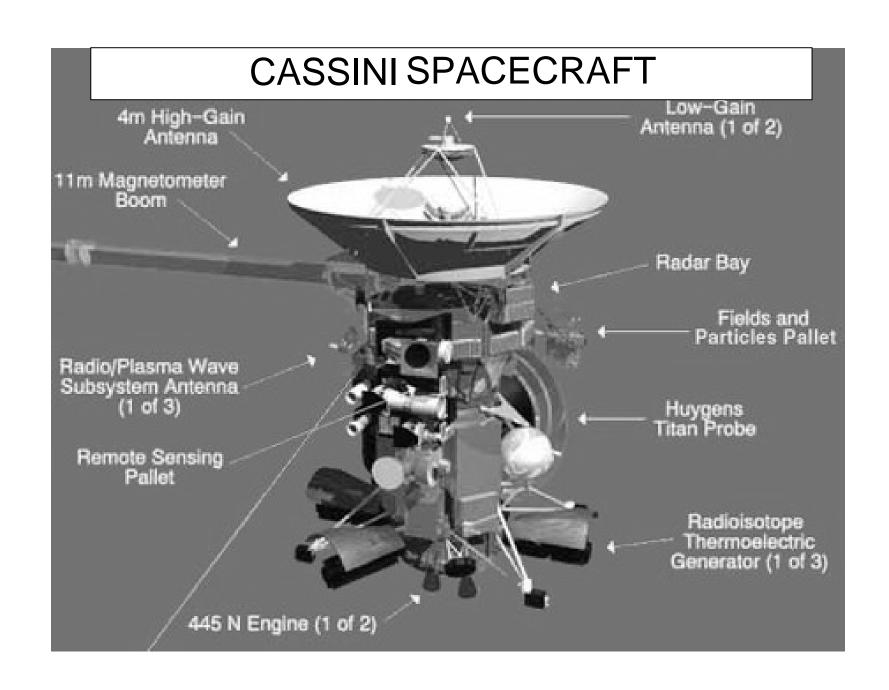

Titan

- Moon of Saturn
- Diameter ~0.4 Earth
- Atmospheric Pressure = $1.5 \times Earth$
- 85% Nitrogen BUT
- Cold (~90 K)
- Reducing atmosphere
- Haze
- Lab for prebiotic chemistry

The Cassini-Huygens Mission

- Launched 10/13/97
- Arrived Saturn 7/2004
- Cassini studies
 - Saturn
 - Moons
- Huygens
 - Dropped onto Titan
 - Study atmosphere
 - Surface

2005 Saturn Tour Highlights:

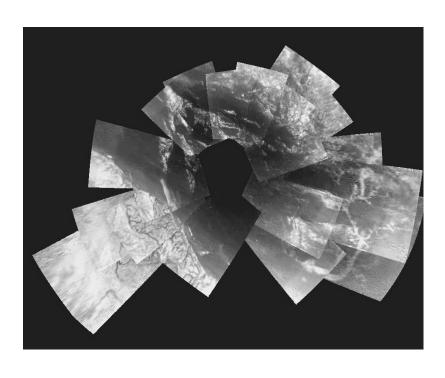

- **Jan. 14, 2005:** The European Space Agency's Huygens probe descends through Titan's cloudy atmosphere, touching down on the surface about two and half hours later. Cassini will send the data back to Earth.
- **Feb. 15, 2005:** Cassini makes another pass by Titan. In 2005, the spacecraft will have six chances to study Titan at altitudes ranging from 1,025 kilometers (637 miles) to 60,000 kilometers (37,290 miles).
- Mar. 9, 2005: Cassini flies within 500 kilometers (311 miles) of icy Enceladus. Cassini will visit Enceladus five times in 2005.
- **Sep. 26, 2005:** Cassini studies Hyperion at a range of 1,010 kilometers (628 miles), the closest approach ever to the tiny moon. It will be Cassini's only visit to the moon during the primary mission.
- Oct. 11, 2005: Cassini turns its instruments on Dione from a distance of 500 kilometers (311 miles).
- Nov. 26, 2005: Cassini passes within 500 kilometers (311 miles) of Rhea.

Huygens Probe

- Released from Cassini
- Slowed by heat shield
- Parachute deploys
- Goal of soft landing
- Sample gases in atm.
- Results so far:
 - High winds
 - 430 km/hr at 120 km

Titan Surface 10km up

- Mosaic of images
- Taken during descent
- Clearly shows features

Photo: ESA

Titan

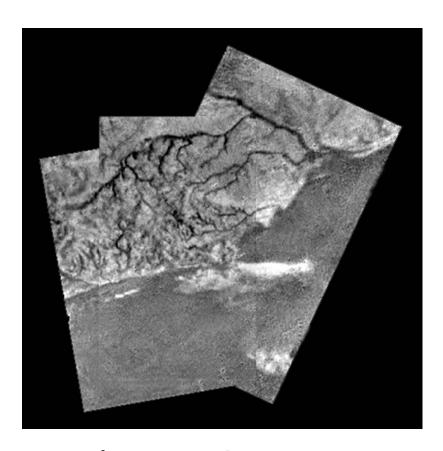

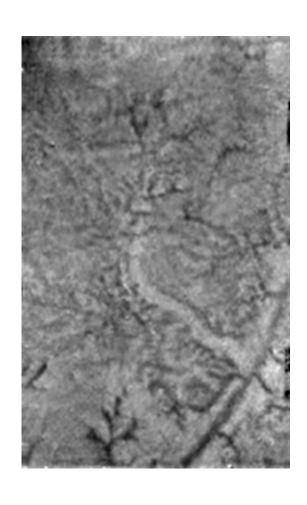

Photo: ESA

- River channel
- Coastline
- Liquid is present
- Methane (CH₄)

Water Rift and Methane Springs?

- Straight feature:
- Water ice extruded?
- Stubby channels:
- Methane springs?

From the surface of Titan

- First view of surface
- "Rocks" of water ice
 - Pebble size (15 cm)
- Surface yielding
- Mixture of ices
 - Water
 - hydrocarbons

More Titan Results

- Hints of ammonia (NH₃)/water (H₂O) ocean
 - Under surface
 - Outgassing of NH₃ may supply N₂ atm.

How to search for life

Have to decide what test indicates life
Hard to anticipate conditions (recall Viking results)
What about finding "protolife"?

National Academy report - how to search for life

- 1. Delivery by comets, meteorites e.g. Mars meteorites
- 2. Sample return Mars possible
- 3. Experiments by landers -

Viking on Mars, ...

Future: Europa probe and return?

Titan?

Issues of contamination

4. Biomarkers

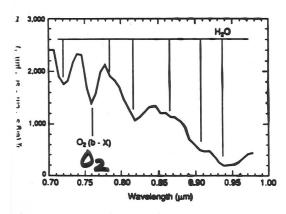

Presence of both O₂ and CH₄ in Earth atmosphere indicative of life How convincing?

Detecting Life on Earth from Space

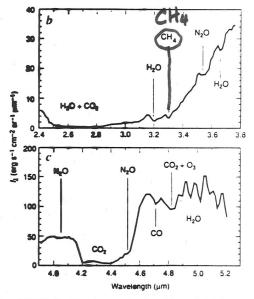

Galileo used during close Earth approach

Photographs (1 km resolution) No clear signs of intelligent life Spectrometers - evidence of life Lots of O₂

1 a, Galileo long-wavelength-visible and near-infrared spectra of larth over a relatively cloud-free region of the Pacific Ocean, north meo. The incidence and emission angles are 77° and 57° respectively. The (b' $\sum_{i=1}^{\infty} -X^3 \sum_{i=1}^{\infty}$) 0–0 band of O_0 at 0.76 μ m is evident, along a number of H_2O features. Using several cloud-free regions of a airmass, we estimate an O_2 vertical column density of 1.5 km-jat \pm 25%. b and c, infrared spectra of the Earth in the 2.4–5.2 μ m n. The strong v_3 CO $_2$ band is seen at the 4.3 μ m, and water vapour s are found, but not indicated, in the 3.0 μ m region. The v_3 band rous oxide, N_2O , is apparent at the edge of the CO $_2$ band near m, and N_2O combination bands are also seen near 4.0 μ m. The

methane (0010) vibrational transition is evident at 3.31 μ m. A cr estimate ¹⁰ of the CH₄ and N₂O column abundances is, for both spec of the order of 1 cm-amagate (\equiv 1 cm path at STP).
