

11/29/06

Exam 4, FRIDAY

Book Chapter 11 (Second Edition, posted Chapter 11 on Gamma-ray Bursts and Chapter 12 on Supernovae and Cosmology).

Review sheet posted.

Fourth and last SkyWatch extra credit anytime before end of classes, December 8. **Credit will be total divided by 4 added to end-of-term average.**

Review session **Tomorrow** Thursday, Nov. 30, 5 PM, RLM 4.102

News: **Mexico Readies World's Largest Radio Telescope - 50 meter diameter**

Pic of the day; Very Large Array radio dish
25 meter diameter

Course survey is now available in the eCIS system at
<https://utdirect.utexas.edu/diia/ecis/>

Should get automatic email

Experiment to do electronically

The University, the Astronomy Department and I all pay attention to these.

Please take the time to fill out the evaluation form.

One Minute Exam:

Einstein says that more distant galaxies move away from us more rapidly because:

- A) The Earth is in the center of the Universe.
- B) The Universe blew up in the Big Bang like a bomb blowing up in three-dimensional space.
- C) Our 3D Universe expands into a 4D hyperspace.
- D) Space expands, carrying all distant galaxies further apart from one another.

Dark Matter

Previously known surprising result:

Most *gravitating* matter in the Universe is mysterious
Dark Matter

Not composed of p, n, e - the stuff of stars, galaxies, planets, and people

Dark Matter was *never* composed of that stuff (or would upset observed mix of hydrogen and helium from the Big Bang), so also not black holes once made from ordinary star stuff.

Some yet undiscovered particles that only interact by gravity and by the weak nuclear force, no electrical force, no strong nuclear force: *100 × more total mass than normal stuff stars, gas, etc.*

Dark Matter

Computer simulations show that from the tiniest wrinkles of quantum uncertainty in the Big Bang, the Dark Matter agglomerates to form all the *Large Scale Structure*, galaxies, clusters of galaxies of the Universe.

Ordinary matter, protons, electrons, settle to center of Dark Matter lumps to form galaxies and clusters of galaxies.

Density of Dark Matter is not enough to close the Universe
⇒ Universe is “open?” (3D Pringle).

Nature recently threw us a curve ball

SN were the key!

Use Type Ia supernovae (brightest, ~ uniform behavior)

Carefully map *distances* (dimmer appearance means further away), *velocities* (Doppler red shifts) in all directions

Do geometry - measure curvature - “sphere”, “Pringle”, “flat”
closed, open, flat

More subtle techniques than making parallel lines or drawing triangles, but still amounts to “doing 3D geometry.”

Type Ia supernovae are generally the brightest and can be seen at cosmological distances.

They were used as cosmological probes...

to discover the *acceleration* of the Universe...

the Science Magazine scientific Breakthrough of the Year in 1998

The supernovae were found to be a little too dim at given expansion velocity (red shift)

⇒ Further away than expected for a “normal” gravitating Universe

How do you get further away in a given time?

⇒ Universe has been *accelerating*!!

Throw ball

Other arguments, especially careful study of the small irregularities of the temperature of the cosmic background radiation left over from the Big Bang, confirm the evidence from supernovae

=> Accelerating Universe - confirmed by all tests applied so far.

=> Universe is filled with an even more mysterious *Dark Energy*,

The dark energy seems to be some sort of force field (like a magnetic field, only different), that permeates the vacuum, empty space, and that that *pushes, anti-gravitates!*

As space expands there is just more vacuum filled with this force field, so the effect is not diluted by the expansion.

Dark Energy Anti-gravitates: cannot be any particle, “normal” (p, n, e) or Dark Matter, that gravitates.

Dark Energy force field is not accounted for by any currently known physics.

A major challenge to fundamental physics!

Pressure Gravitates

Dark Matter Gravitates

1/3 of that needed to be flat (3D)

Tension Anti-Gravitates

Dark Energy Anti-Gravitates

2/3 of that needed to be flat (3D)

Total $1/3 + 2/3 = 1$ just the right total mass/energy to be flat (3D) within observational uncertainty of 10 - 20%.

The stuff that we and the Sun and stars are made of is essentially irrelevant to this argument, there is too little of it in the Universe.

Most of the stuff of which the Universe is composed is substances, Dark Matter, Dark Energy, completely unlike us.

The best current guess is that our real 3D Universe is essentially flat

But accelerating!

The Universe is Flat (in 3D) on average

Still have individual stars, neutron stars, black holes, galaxies, that curve the space around them causing the small scale, local effects of gravity.

Just as a table top is composed of atoms and molecules on small scales, but is flat for all practical purposes when we sit down to eat.

One Minute Exam

Dark Matter is responsible for

- A) The acceleration of the Universe
- B) The dark space between stars and galaxies
- C) The clumping of matter to form stars and galaxies
- D) The Dark Ages after the initial Big Bang

Nature of Dark Energy

Energy of vacuum - quantum fluctuations, particle/anti-particle
(recall role in Hawking radiation) predict an acceleration that
is too large by a factor $\times 10^{120}$

“Worst prediction ever in physics,”
Steven Weinberg (UT Nobel Laureate)

Related phase early in Big Bang, when the Universe was a fraction of
a second old,

A huge “inflation” by anti-gravitating vacuum force blows the
Universe so big that it is essentially flat (like the surface of the
Earth appears to us, only moreso!)

Anti-gravitating energy went away - has come back gently.
What is it???

Einstein's theory of the behavior of the Universe contained a "Cosmological Constant," that could be positive, negative, or zero.

Einstein first argued it was positive in order to provide a force to counteract gravity to keep the Universe from expanding or contracting, but then the expansion of the Universe was discovered and he called it a "blunder."

Current results on the expansion are consistent with the Dark Energy being just the value set by Einstein.

Even if true, we still need to know what it is, physically!

Theories of quantum fields suggest that the Dark Energy could or should vary with time and space.

One theory called “quintessence” (the fifth essence, after the Greek earth, air, fire, and water) would have that property.

Other theories call for interaction with other 3D Universes “elsewhere” in hyperspace.

The race is on to determine whether the Dark Energy is constant or not.

If the Dark Energy is roughly constant, as the Universe expands, the density of gravitating stuff (Dark Matter and normal matter) decreases in a given volume, but the Dark Energy, a property of empty space, stays the same.

The Dark Matter and gravity would be strongest early on, but Dark Energy, anti-gravity and acceleration would come to dominate.

Results from the Hubble Space Telescope suggest the Universe switched to acceleration about 5 billion years ago.

Why then?

One Minute Exam

The type of supernova used to discover the acceleration of the Universe was

- A) Type Ia
- B) Type Ib
- C) Type Ic
- D) Type II

The Fate of the Universe?

If the acceleration stays constant, the fate is rather dismal: galaxies will be pulled infinitely far apart, then even small mass, long-lived stars age and die, protons, neutrons and electrons will decay to photons, black holes will evaporate by Hawking radiation.

The result would be an empty Universe filled with dilute radiation.

We know so little about the Dark Energy, that it could do other things.

It could get stronger, leading to a ***Big Rip*** with atoms and the very fabric of space being pulled apart (most physicists think this unlikely)

It could reverse sign and gravitate, leading to the recollapse of the Universe in a ***Big Crunch***.
