

Communication

Communication

Much cheaper than travel

Energy needed for Mass (M) at speed (v)

$$E = 1/2 Mv^2 \quad \text{if } v \text{ much less than } c$$

e.g., travel to nearest star (4 ly) in 40 yr

$$\Rightarrow v = 0.1 c \quad \Rightarrow \quad E = 4.1 \times 10^{-9} \text{ ergs}$$

for $M = M$ (electron)

Photon $E = h\nu$ $h = 6.6 \times 10^{-27}$
 $\nu = \text{frequency}$
 $= 6.6 \times 10^{-18} \text{ ergs}$ if $\nu = 10^9 \text{ Hz}$
Ratio $\sim 10^9$ (and photon gets there in 4 yrs)

100 M watt transmitter - 1 yr
 $\$ 40 \times 10^6$

Spacecraft to nearest star
 $\sim \$ 5 \times 10^{16}$
(some recent analysis questions this conclusion)

Light is an Electromagnetic Wave

Electric Field: Indicates force on charged particle

Magnetic field: created by changing electric field. At right angle to electric field.

Electromagnetic Wave

Wave Properties

Snapshot

A = Amplitude
 λ = Wavelength

Wave Properties

Look at one point along wave

$$\nu = \text{frequency} = \frac{1}{\text{period}}$$

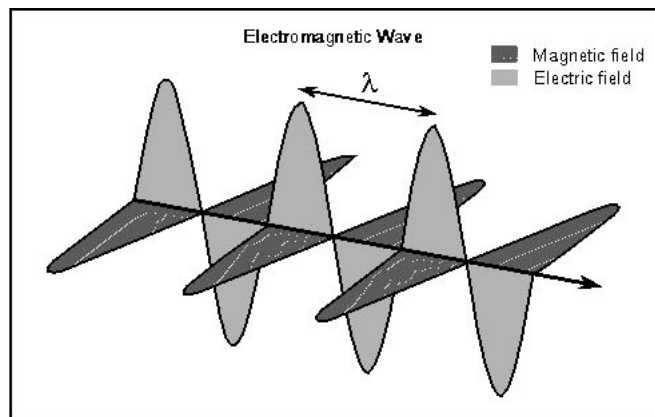

of cycles per second (hertz, Hz)

$$1 \text{ kHz} = 10^3 \text{ Hz} \quad 1 \text{ MHz} = 10^6 \text{ Hz}$$

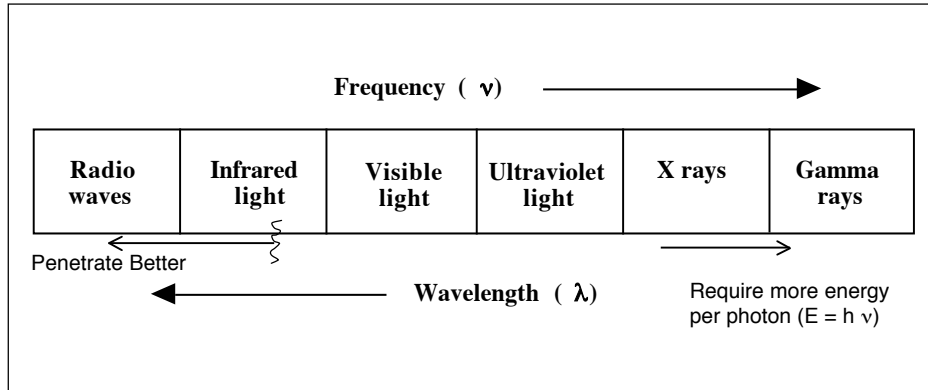

$$1 \text{ GHz} = 10^9 \text{ Hz}$$

$$\text{Speed of light} \quad c = \lambda \nu \Rightarrow \lambda = \frac{c}{\nu}$$

A Wave Demo

Electromagnetic Spectrum (Light)

Noise: Any unwanted signal Artificial, Natural

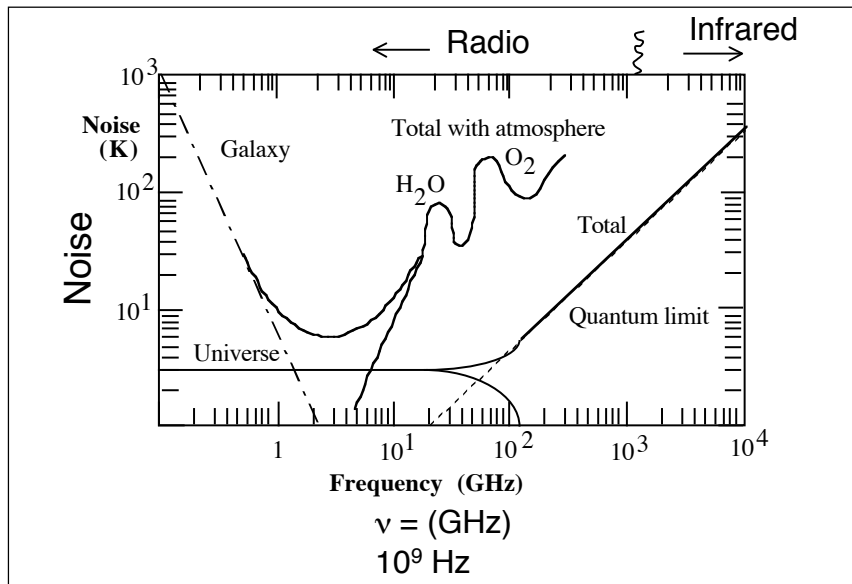

Figure 6.8

Free-space microwave window, in which the basic noises that limit radio communication over interstellar distances are least disruptive.

Terrestrial microwave window. Atmospheric water vapor and oxygen degrade the upper end of the microwave window for receivers on Earth's surface and raise the temperature in the lower portion of the window.

Magic Frequencies

1. Morrison & Cocconi 1959
 $\nu = 1.42 \text{ GHz}$ $\lambda = 21 \text{ cm}$
 H atoms

2. Water "Hole"
 OH 1st molecule discovered at Radio λ
 $\nu = 1.6 \text{ GHz}$
 $\text{H} + \text{OH} \longrightarrow \text{H}_2\text{O}$

Low Noise "Hole"

1.4
1.6 GHz

3. Kuiper - Morris

Use fundamental constants

$$\nu = \frac{c}{\text{length}} \quad \text{all very high } \nu$$

Most plausible is electron "radius"

Scale by powers of "fine structure constant"

$$\sim \frac{1}{137} \quad (\text{if multiply 5 times, get to radio})$$

$$\rightarrow \nu = 2.5568 \text{ GHz}$$

Radio Telescope Principle

Green Bank Telescope (GBT)

Arecibo Telescope

Very Large Array (VLA)

Very Long Baseline Array (VLBA)

Caltech Submillimeter Observatory (CSO)

Atacama Large Millimeter Array (ALMA)

Allen Telescope Array (ATA)
