

Life in the Outer Solar System

Jupiter

Big

$$R = 11R_{\oplus}$$

Massive

$$M = 300 M_{\oplus}$$

= 2.5 all the rest

Mostly H_2 , He Thick Atmosphere
But also more complex molecules
Colors, storms

Like Miller - Urey

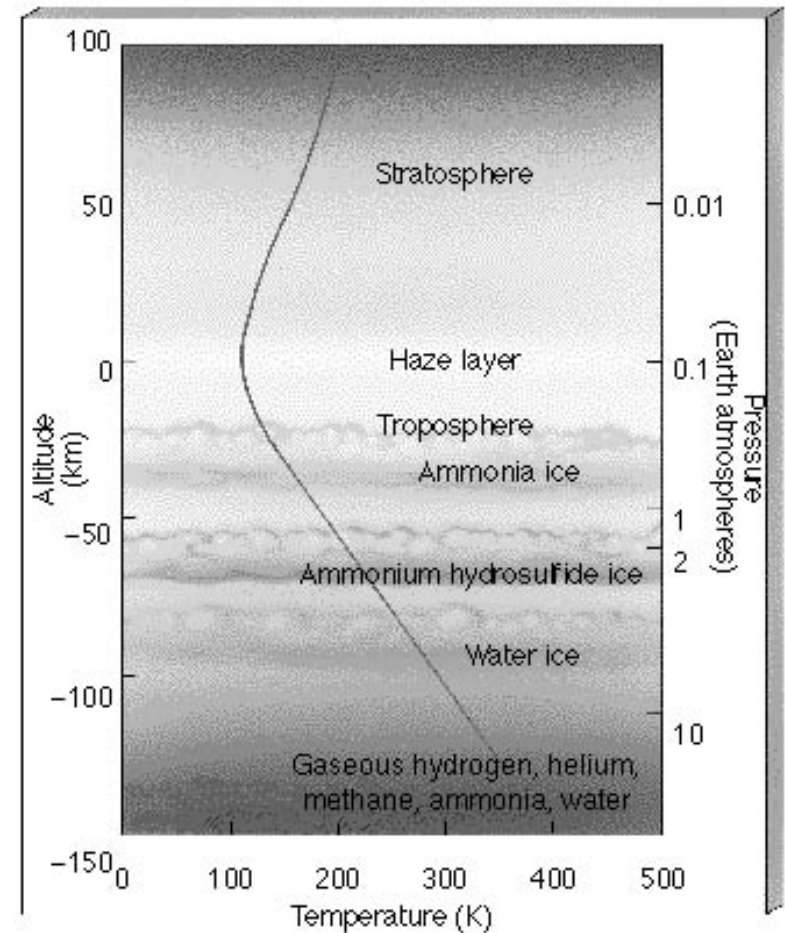

Life in Jupiter Atmosphere?

Sagan-Salpeter, etc.

Sinkers (Plankton)

Floaters (Fish)

Hunters (Fish)

Galileo Results on Jupiter

Reached Jupiter Dec. 1995 Sent probe into Jupiter's atmosphere at 100,000 mile/hour

Decelerated at 230 g Lasted for 57 min.

Found: Strong winds

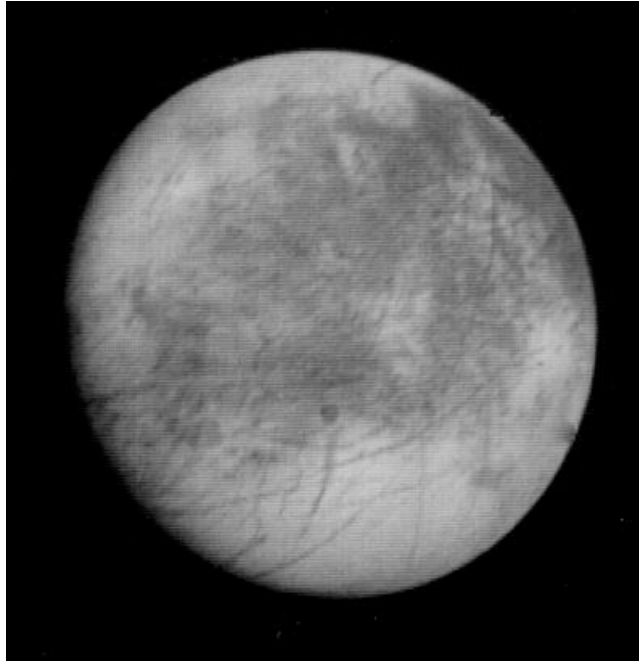

Turbulence, little lightning

Surprise: Little or no H₂O

May have entered in an unusual place (fewer clouds)

Life less likely?

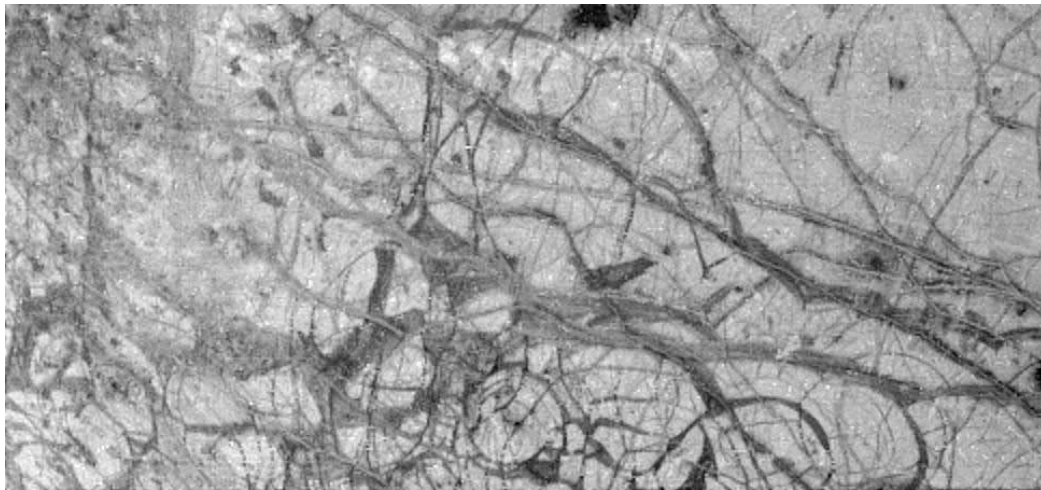

Europa (Moon of Jupiter)

Surface: Fractured Ice

Subsurface Oceans?

(Heated from Inside)

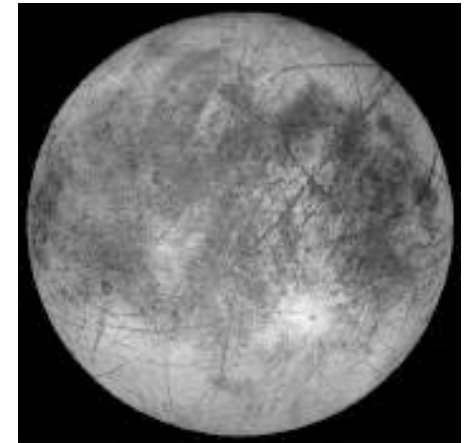

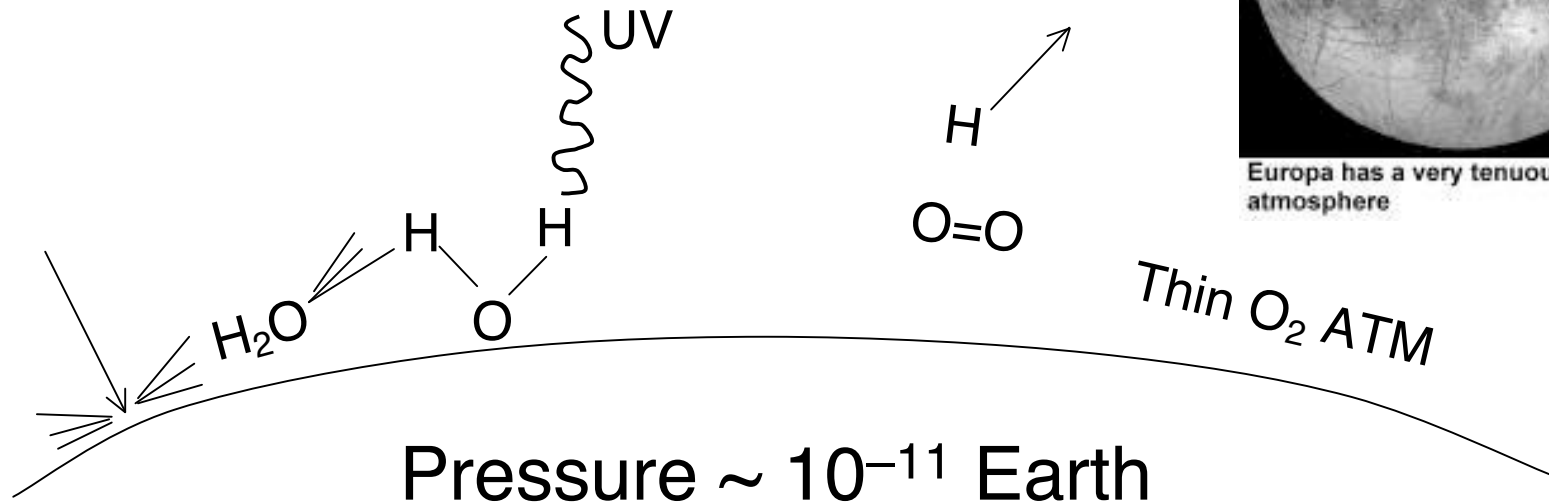

Close-up of "ice floes"

Galileo - Jupiter's Moons

<http://www.jpl.nasa.gov/galileo/index.html>

Europa has a (THIN!) atmosphere

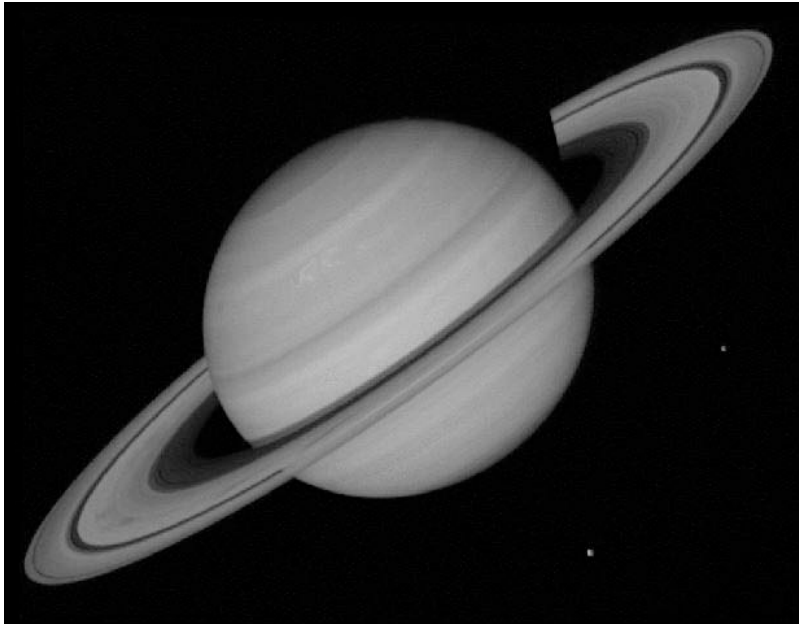

Europa has a very tenuous atmosphere (NASA)

More evidence for resurfacing along cracks by

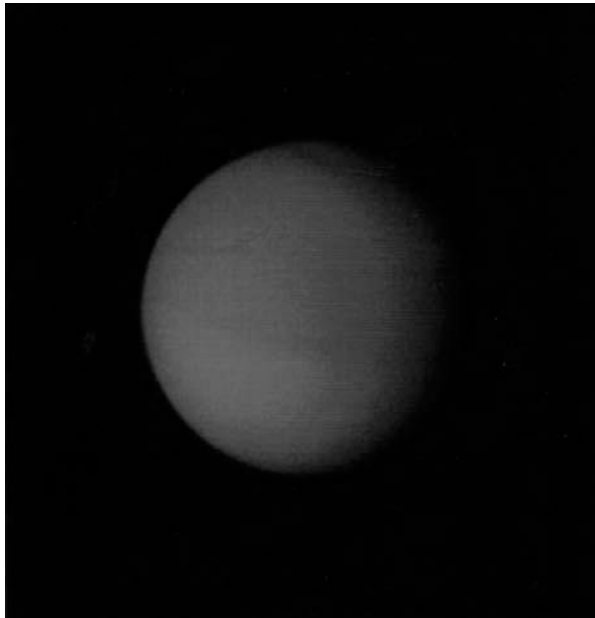

“ice geysers” \longrightarrow fluid ice or liquid water

Organic molecules on Callisto & Ganymede, maybe Europa?

Saturn

- Big ($9.4 R_{\oplus}$)
- Massive ($95 M_{\oplus}$)
- Year 29.5 years
- Day 0.43 days
- Composition similar to Jupiter

Titan

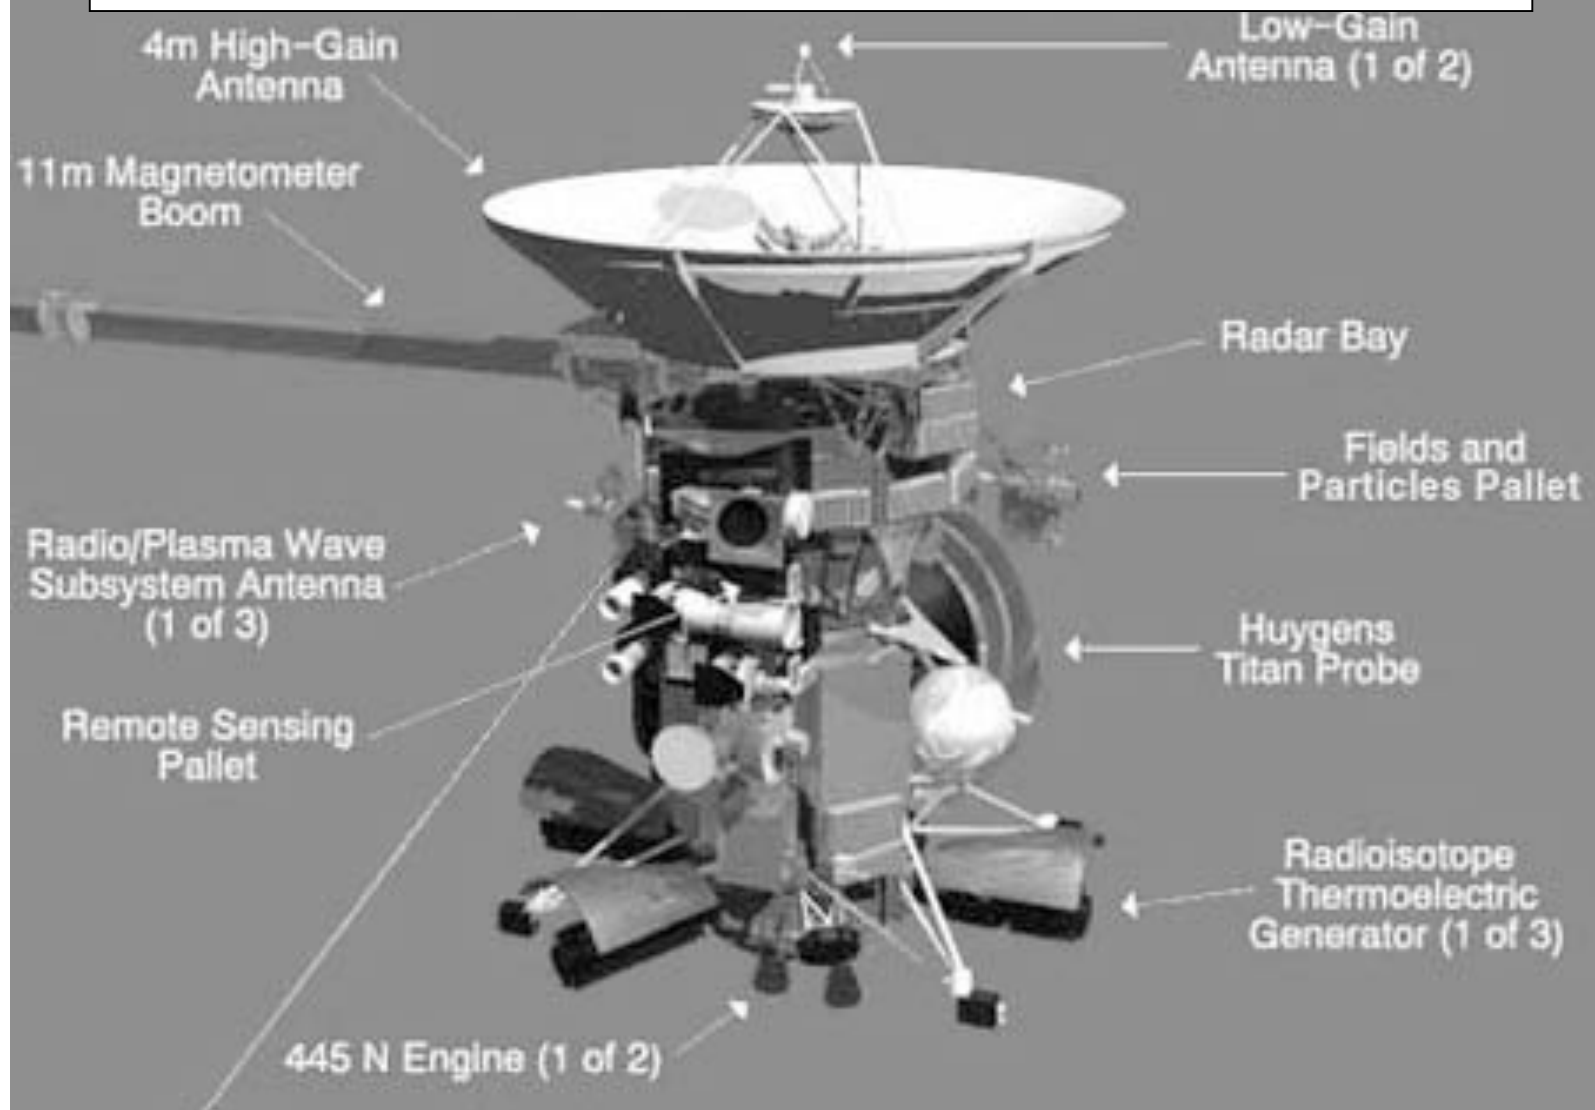

- Moon of Saturn
- Diameter ~ 0.4 Earth
- Atmospheric Pressure = $1.5 \times$ Earth
- 85% Nitrogen BUT
- Cold (~ 90 K)
- Reducing atmosphere
- Haze
- Lab for prebiotic chemistry

The Cassini-Huygens Mission

- Launched 10/13/97
- Arrived Saturn 7/2004
- Cassini studies
 - Saturn
 - Moons
- Huygens
 - Dropped onto Titan
 - Study atmosphere
 - Surface

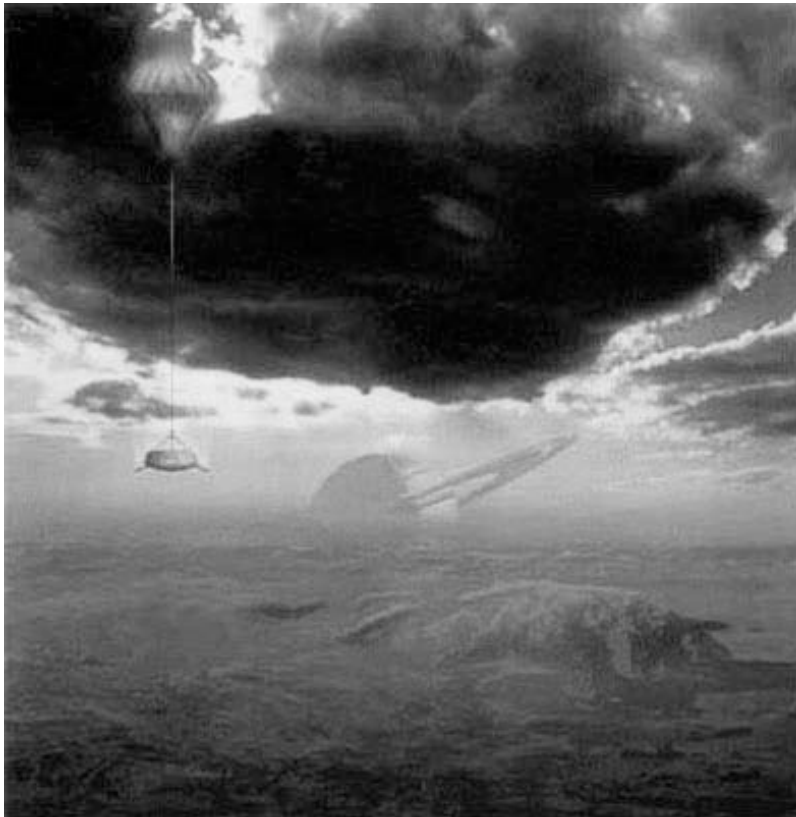

CASSINI SPACECRAFT

2005 Saturn Tour Highlights:

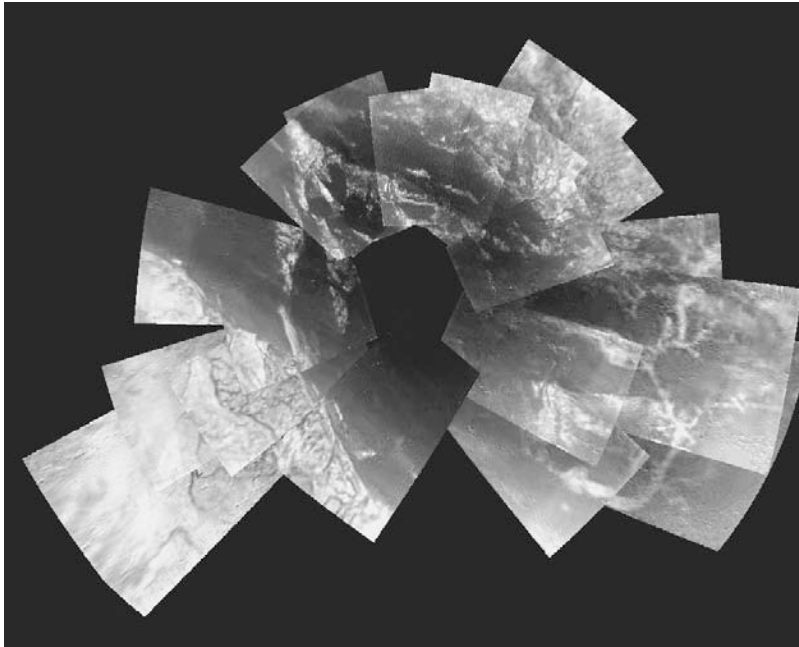

- **Jan. 14, 2005:** The European Space Agency's Huygens probe descends through Titan's cloudy atmosphere, touching down on the surface about two and half hours later. Cassini will send the data back to Earth.
- **Feb. 15, 2005:** Cassini makes another pass by Titan. In 2005, the spacecraft will have six chances to study Titan at altitudes ranging from 1,025 kilometers (637 miles) to 60,000 kilometers (37,290 miles).
- **Mar. 9, 2005:** Cassini flies within 500 kilometers (311 miles) of icy Enceladus. Cassini will visit Enceladus five times in 2005.
- **Sep. 26, 2005:** Cassini studies Hyperion at a range of 1,010 kilometers (628 miles), the closest approach ever to the tiny moon. It will be Cassini's only visit to the moon during the primary mission.
- **Oct. 11, 2005:** Cassini turns its instruments on Dione from a distance of 500 kilometers (311 miles).
- **Nov. 26, 2005:** Cassini passes within 500 kilometers (311 miles) of Rhea.

Huygens Probe

- Released from Cassini
- Slowed by heat shield
- Parachute deploys
- Goal of soft landing
- Sample gases in atm.
- Results so far:
 - High winds
 - 430 km/hr at 120 km

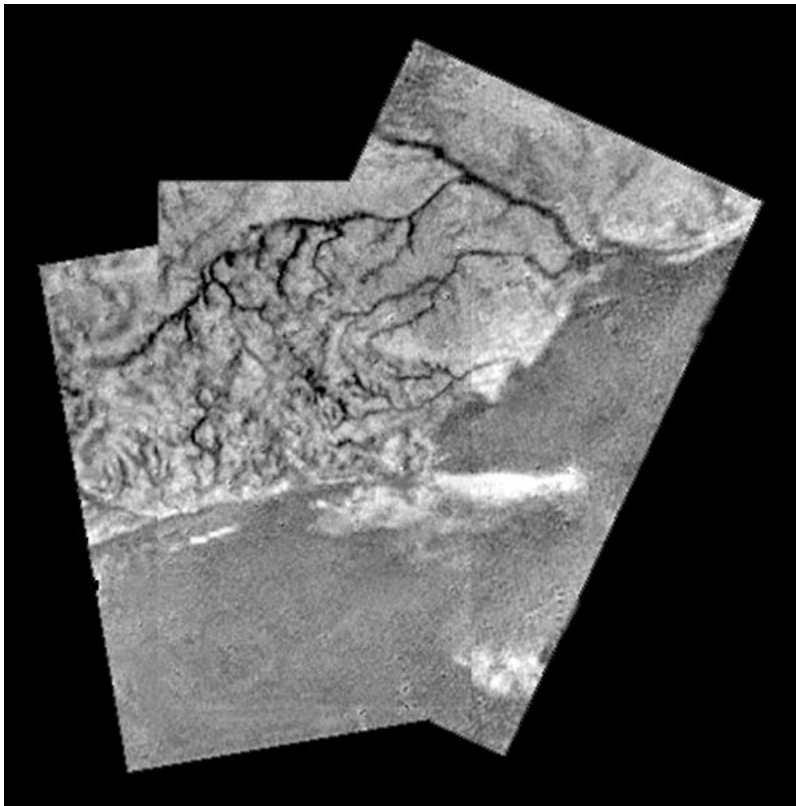

Titan Surface 10km up

- Mosaic of images
- Taken during descent
- Clearly shows features

Photo: ESA

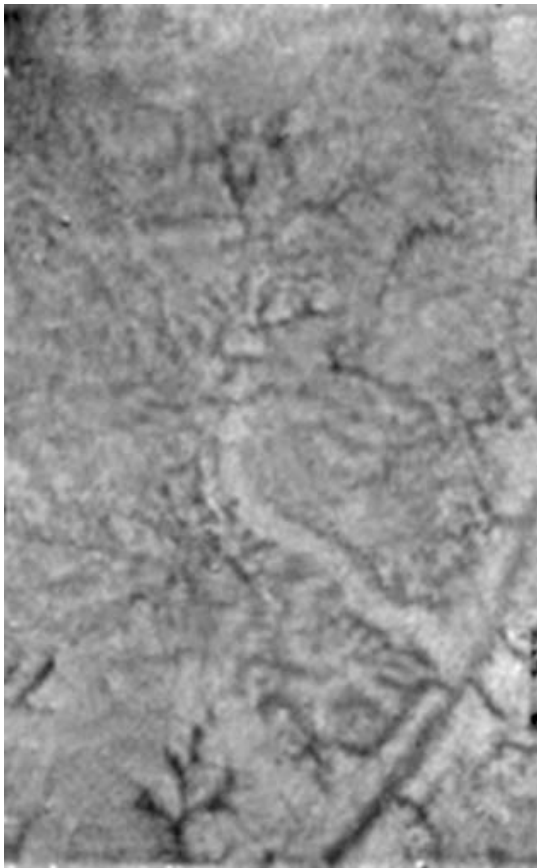

Titan

- River channel
- Coastline
- Liquid is present
- Methane (CH_4)

Photo: ESA

Water Rift and Methane Springs?

- Straight feature:
- Water ice extruded?
- Stubby channels:
- Methane springs?

From the surface of Titan

- First view of surface
- “Rocks” of water ice
 - Pebble size (15 cm)
- Surface yielding
- Mixture of ices
 - Water
 - hydrocarbons

More Titan Results

- Hints of ammonia (NH_3)/water (H_2O) ocean
 - Under surface
 - Outgassing of NH_3 may supply N_2 atm.

How to search for life

Have to decide what test indicates life

Hard to anticipate conditions (recall Viking results)

What about finding “protolife”?

National Academy report - how to search for life

1. Delivery by comets, meteorites e.g. Mars meteorites
2. Sample return - Mars possible
3. Experiments by landers -

Viking on Mars, ...

Future: Europa probe and return?

Titan?

Issues of contamination

4. Biomarkers

Presence of both O_2 and CH_4 in Earth atmosphere
indicative of life

How convincing?

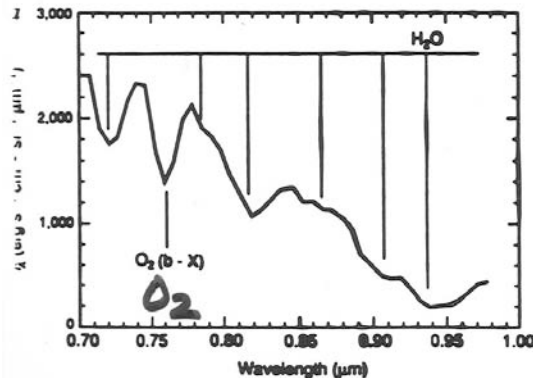

Detecting Life on Earth from Space

Galileo used during close Earth approach

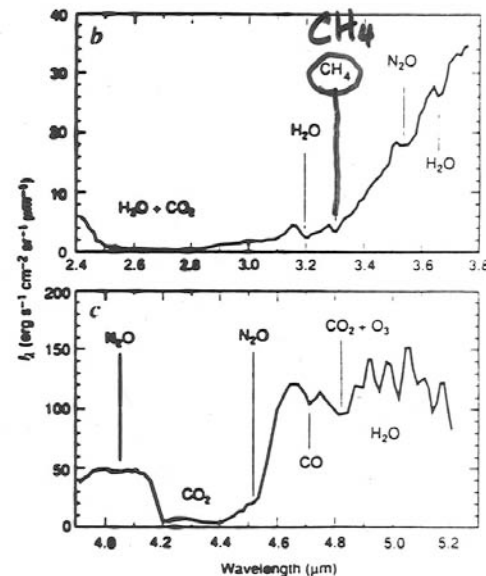

Photographs (1 km resolution) No clear signs of intelligent life

Spectrometers - evidence of life Lots of O₂

CH₄

1 a. Galileo long-wavelength-visible and near-infrared spectra of Earth over a relatively cloud-free region of the Pacific Ocean, north meo. The incidence and emission angles are 77° and 57° respectively. The (b'Σ_g⁺→X³Σ_g⁻) O-O band of O₂ at 0.76 μm is evident, along a number of H₂O features. Using several cloud-free regions of 1g airmass, we estimate an O₂ vertical column density of 1.5 km⁻¹ at ± 25%. b and c. Infrared spectra of the Earth in the 2.4–5.2 μm n. The strong ν₃ CO₂ band is seen at the 4.3 μm, and water vapour s are found, but not indicated, in the 3.0 μm region. The ν₃ band rous oxide, N₂O, is apparent at the edge of the CO₂ band near m, and N₂O combination bands are also seen near 4.0 μm. The

methane (0010) vibrational transition is evident at 3.31 μm. A cr estimate¹⁰ of the CH₄ and N₂O column abundances is, for both spec of the order of 1 cm-amagat (≡ 1 cm path at STP).
