Communication, 2.

Search Strategies

- Basic Problem: where to look?
- Possible Scenarios
  - Powerful, omnidirectional beacons
    - Implies very advanced civilization
    - Seeking to attract attention of new civilizations
  - Nearby, not so advanced, broadcasting to us
    - Unlikely
  - Detect leakage radiation

Leakage Radiation

- Various sources
  - TV, radio, …
    - Repeatable pattern due to Earth rotation
  - Defense radars
    - Most powerful, but won’t repeat

TABLE 20-1

ESTIMATED POWER OUTPUT OF VARIOUS RADIO-PHOTON SOURCES THAT OPERATE AT FREQUENCIES GREATER THAN 20 MHz

Source	Frequency Range (MHz)	Number of Transmitters	Fraction of Time that Transmitters Emit	Per Individual Transmitter: Maximum Power Radiated (watts)	Per Individual Transmitter: Effective Frequency Bandwidth (hertz)	Total Average Power Radiated (watts per hertz of bandwidth)[a]
Citizen-band radios	27	10,000,000	1/100	5	2	200,000
Professional landmobile radios	20–500	100,000	1/10	20	1	200,000
Weather, marine, and air radars	1000–10,000	100,000	1/100	10,000 to 1,000,000	1,000,000	10 to 1000
Defense radars[b]	400	2	1/10	10,000,000,000	0.1	20,000,000,000
FM radio stations	88–108	10,000	1	4000	0.1	400,000,000
TV stations (for photons that carry picture, not sound)	40–850	2000	1	500,000	0.1	10,000,000,000

[a] The last column shows the power radiated *per hertz of bandwidth*. Systems that cover a wider bandwidth (most noticeably, weather, marine, and air radars) will radiate a greater total power over *all* frequencies than this column would suggest. This table, as well as Figures 20-7, 20-8, and 20-9 follow the results of a study made by W. Sullivan III, S. Brown, and C. Wetherill in *Science*, vol. 199, p. 377, 1978.

[b] We have considered only the most powerful defense radars; these dominate the total power output from all such radar systems.

5.—Coordinates of strong spectral features for run A (1420 MHz). Thresholds are (*a*) $22P_0$ and (*b*) $28P_0$. The dashed line is the Galactic pla center.

BETA

Successor to META

2.5×10^8 channels

0.5 Hz channel width

Covers 1.4 - 1.7 GHz in 8 steps

Sensitivity: 2×10^{-22} W m^{-2}

Started 1995, suspended in Spring 1999

(antenna blew off mount!)

repairs underway

NASA Search

~~To begin~~ began ~~ended~~ → revived?

To begin Oct. 12, 1992

Microwave Observing Program (MOP)

Main improvement: frequency coverage

2 parts:

1. All sky survey - JPL - run

   Telescopes of modest 34-m diameter

   California, Australia, …

   Cover 1 - 10 GHz

   2×10^6 channels 16×10^6 channels (~ 1996)

   Channel width: 20 Hz

Coverage: 40 MHz , 320 MHz

right and left circular polarization

Sensitivity: only spend a few sec. per direction

⇒ strong signal

(Arecibo Planetary Radar)

out to 25 ℓy

Timespan: 6 years to cover sky once

2. Targeted search - Ames - run

(~ 800 Nearest (< 75 ly) stars like Sun)

Largest telescopes available:

Arecibo 300 m (244 stars)

+ Australia, France, …

Cover: 1 - 3 GHz

16×10^6 channels

Channel width: 1 Hz

Coverage: 10 MHz

right and left circular polarization

Sensitivity: ~ 10^3 sec. per star

$\Rightarrow 10^{-27}$ W m^{-2}

$P_{trans} = 10^{-27}$ W m$^{-2} \cdot 4\pi\, d^2(m)$

$d(m) \simeq 10^{16}\, d(\ell y)$

$P_{trans} \simeq 10^6\, d^2(\ell y)$ = 1 M Watt at 1 ℓy

e.g. 100 Mega Watts at d = 10 ℓy

Defense radars to ~ 1000 ℓy

HR 5158

EXCERPTS REGARDING SETI

101st Congress of the United States, 2nd Session

From Senate Report 101-474, to accompany H.R. 5158, from the Departments of Veterans Affairs, HUD and Independent Agencies Appropriation Bill, 1991, dated September 16, 1990 (Senator Barbara Mikulski--chair):

Regarding the NASA budget:

"...For life sciences, the Committee recommends the following:

-$25,000,000 from the $168,000,000 requested for life sciences, to be taken as a general reduction, subject to the normal reprogramming guidelines. None of this reduction is to be taken from the request for the search for extraterrestrial intelligence (SETI) program.

1990

"In recommending the full budget request of $12,100,000 for the SETI program, the Committee reaffirms its support of the basic scientific merit of this experiment to monitor portions of the radio spectrum as an efficient means of exploring the possibility of the existence of intelligent extraterrestrial life. While this speculative venture stimulates widespread interest and imagination, the Committee's recommendation is based on its assessment of the technical and engineering advances associated with the development of the monitoring devices needed for the project and on the broad educational component of the program. The fundamental character of the SETI program provides unique opportunities to explain principles of such scientific disciplines as biology, astronomy, physics, and chemistry, in addition to exposing students to the development and application of microelectronic technology.

"The Committee has included the full request of $2,000,000 for the Lifesat project..."

$14.5 MILLION FY92

From the Joint House-Senate Conference Report for Veterans Affairs, HUD and Independent Agencies (approved on October 17, 1990):

$0 FY94 !

Regarding the NASA budget:

"...- $25,000 from Life Sciences

"The Conferees agree that within the balance of funds available in this action, $12,100,000 shall be allocated to the Search for Extraterrestrial Intelligence and $2,000,000 for Lifesat..."

SEARCH IS DESCRIBED IN CHAP. 9

Congress may hang up on research of E.T.s

■ Extraterrestrials won't be able to phone home if there's nobody on earth to take the call

By Keay Davidson
New York Times News Service

SAN FRANCISCO — Who killed E.T.?

An effort by the National Aeronautics and Space Administration effort to detect signals from extraterrestrials has been axed by Congress.

Experts blame everything from its "giggle factor" to poor salesmanship to Congress' unwillingness to cut politically stronger programs.

Hollywood has made big money from fictional extraterrestrials, and they clutter TV shows and grocery-store tabloids.

But NASA's $104 million attempt to find real aliens — the Mountain View, Calif., High Resolution Microwave Survey — was too costly for a joint congressional committee. It agreed to end the program just one year into its planned 10-year search. The program is popularly known by its previous name, Search for Extraterrestrial Intelligence, or SETI.

"I'm pretty depressed," said Pe-

Critics accuse Congress of making SETI a sacrificial lamb after failing to kill two programs — the oft-maligned space station and the $3 billion Advanced Solid Rocket Motor, which *Reader's Digest* last year called "the unstoppable pork booster." It's based in Yellow Creek, Miss., home to Democratic Rep. Jamie Whitten, who until last year chaired the House Appropriations Committee.

Project staff members took pride in the program's size. "Each space shuttle launch has been estimated to cost as much as $1 billion. That's a century worth of SETI research," said Seth Shostak of the quasi-private SETI Institute in Mountain View.

But politically, "the SETI people made a fundamental mistake — stupid, stupid, stupid! — in the way they've been lobbying for their programs," said John Pike, a policy expert with the Federation of American Scientists in Washington. "SETI is one of the things that is most readily understood and widely appreciated by the public.

Ralph De Gennaro, a senior budget analyst for Friends of the Earth in Washington, D.C., shed no tears for SETI.

"I'm sick and tired of being told that we can't afford to save this planet but we do have enough money to listen to aliens on other
