

Communication, 2.

Search Strategies

- Basic Problem: where to look?
- Possible Scenarios
 - Powerful, omnidirectional beacons
 - Implies very advanced civilization
 - Seeking to attract attention of new civilizations
 - Nearby, not so advanced, broadcasting to us
 - Unlikely
 - Detect leakage radiation

Leakage Radiation

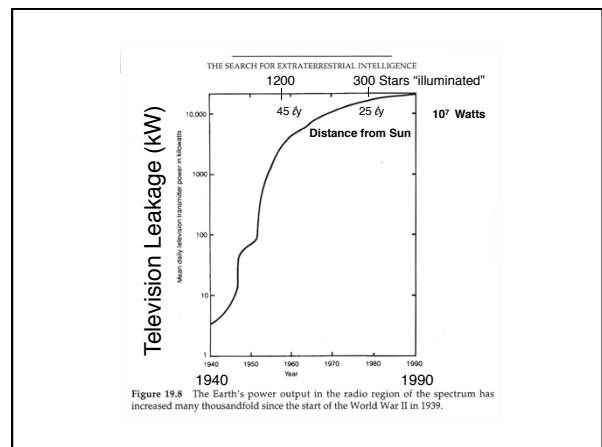

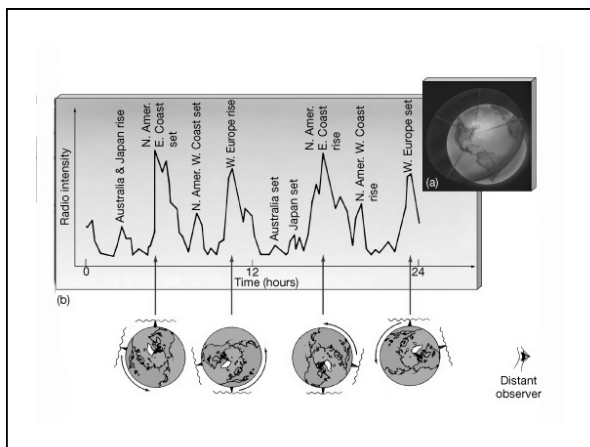

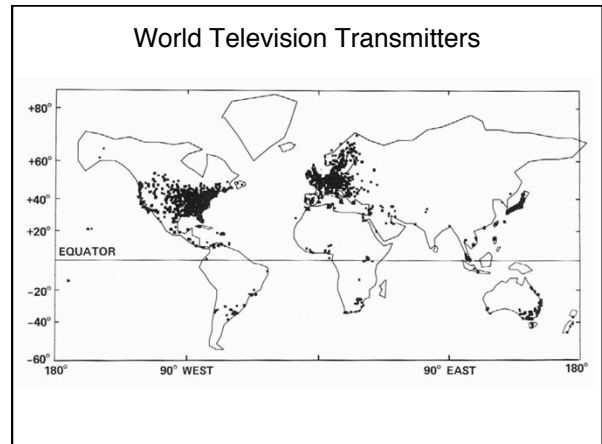

- Various sources
 - TV, radio, ...
 - Repeatable pattern due to Earth rotation
 - Switch to digital TV in June 2009
 - Some changes, but similar frequencies used
 - Defense radars
 - Most powerful, but won't repeat

TABLE 20-1
ESTIMATED POWER OUTPUT OF VARIOUS RADIO-PHOTON SOURCES THAT OPERATE AT FREQUENCIES GREATER THAN 20 MHz

Source	Frequency Range (MHz)	Number of Transmitters	Fraction of Time that Transmitters Emit	Per Individual Transmitter		Total Average Power Radiated (watts per hertz of bandwidth) ^a
				Maximum Power Radiated (watts)	Effective Frequency Bandwidth (hertz)	
Citizen-band radios	27	10,000,000	$1/100$	5	2	200,000
Professional landmobile radios	20-500	100,000	$1/10$	20	1	200,000
Weather, marine, and air radars	1000-10,000	100,000	$1/100$	10,000 to 1,000,000	1,000,000	10 to 1000
Defense radars ^b	400	2	$1/10$	10,000,000,000	0.1	20,000,000,000
FM radio stations	88-108	10,000	1	4000	0.1	400,000,000
TV stations (for photons that carry picture, not sound)	40-850	2000	1	500,000	0.1	10,000,000,000

^aThe last column shows the power radiated *per hertz of bandwidth*. Systems that cover a wider bandwidth (most noticeably, weather, marine, and air radars) will radiate a greater total power over all frequencies than this column would suggest. This table, as well as Figures 20-7, 20-8, and 20-9 follow the results of a study made by W. Sullivan III, S. Brown, and C. Wetherill in *Science*, vol. 199, p. 377, 1978.

^bWe have considered only the most powerful defense radars; these dominate the total power output from all such radar systems.

The Cosmic Haystack

Frequency

Large frequency range

But narrow channels

↓

Lots of channels

Direction

Large number of directions

Small beam

Conflict

Sensitivity

$$S \propto D^{-2} t^{-1/2}$$

want small S

Large telescope

Long time per direction

Strong signals, unknown origin

⇒ Small telescope, short t, cover sky

Weak signals, nearby stars

⇒ Large telescope, longer t, only stars

Cosmic Haystack

INTERSTELLAR RADIO AND TELEVISION MESSAGES

Figure 19.5 Concentrating a signal into a narrower bandpass makes it much easier for the signal to stand out against the background noise that exists at all frequencies.

 $P_{\text{trans}} = 10^{-27}$ W m $^{-2} \cdot 4\pi d^2(m)$
 $d(m) \simeq 10^{16} d(\epsilon y)$
 $P_{\text{trans}} \simeq 10^6 d^2(\epsilon y) = 1$ M Watt at 1 ϵy
 e.g. 100 Mega Watts at $d = 10 \epsilon y$
 Defense radars to $\sim 1000 \epsilon y$

HR 5158

EXCERPTS REGARDING SETI 101st Congress of the United States, 2nd Session

From Senate Report 101-414, accompanying H.R. 5158 from the Department of Commerce, H.R. 5158 and Independent Agencies Appropriation Bill, 1991, dated September 16, 1990 (Senator Barbara Mikulski—Chair):

Regarding the NASA budget:

"... For life sciences, the Committee recommends the following: \$25,000,000 from the \$168,000,000 requested for life sciences, to be taken as a general reduction, subject to the normal reprogramming guidelines. None of this reduction is to be taken from the request for the search for extraterrestrial intelligence (SETI) program."

"In recommending the full budget request of \$12,100,000 for the SETI program, the Committee reaffirms its support of the basic scientific merit of this experiment to monitor portions of the radio spectrum as an efficient means of exploring the possibility of the existence of intelligent extraterrestrial life. While this speculative venture stimulates widespread interest and imagination, the Committee's recommendation is based on its assessment of the technical and engineering advances associated with the development of the monitoring devices needed for the project and on the broad educational component of the program. The fundamental character of the SETI program provides unique opportunities to explain principles of such scientific disciplines as biology, astronomy, physics, and chemistry, in addition to exposing students to the development and application of microelectronic technology."

"The Committee has included the full request of \$2,000,000 for the Lifesat project..."

H. S. MILLER FY92

From the Joint House-Senate Conference Report for Veterans Affairs, HUD and Independent Agencies (approved on October 17, 1990):

Regarding the NASA budget:

"... \$25,000 from Life Sciences"

"The Conference agree that within the balance of funds available in this act, \$12,100,000 shall be allocated to the Search for Extraterrestrial Intelligence and \$2,000,000 for Lifesat..."

Congress may hang up on research of E.T.s

■ Extraterrestrials won't be able to phone home if there's nobody on earth to take the call

By Kary Davidson
New York Times News Service

SAN FRANCISCO — Who killed E.T.?

An effort by the National Aeronautics and Space Administration to detect signals from extraterrestrials has been snared by Congress.

Reporters blame everything from the "apple factor" to poor management to Congress' unwillingness to cut politically stronger programs.

Hollywood has made big money from fictional extraterrestrials, and they clutter TV shows and grocery store shelves.

But NASA's \$104 million attempt to find red aliens at the Mountain View, Calif., High Resolution Microwave Survey was too costly for a joint congressional committee. It agreed to end the program just one year into its planned 10-year search for extraterrestrial intelligence, or SETI.

"The money drained," said Dr.

Colin, across Congress of making SETI a sacrificial lamb after failing to kill two programs — the \$3 billion Advanced Solid Rocket Motor, which Boeing's Dugout last year called "the catastrophic pork barrel," it's based in Yellow Creek, Miss., home to Democratic Rep. James Whitman, who until last year chaired the House Appropriations Committee.

Project staff members took pride in the program's aim. "Each space shuttle launch has been estimated to cost as much as \$1 billion. That's a century worth of SETI research," said Seth Shostak of the quasi-private SETI Institute in Mountain View.

But politically, "the SETI people made a fundamental mistake — stupid, stupid, stupid! — in the way they've been lobbying for their program," said John Fila, a policy expert with the Federation of American Scientists in Washington.

"SETI is one of the things that is most readily understood and widely appreciated by the public," Fila said.

Ralph De Gennaro, a senior budget analyst for Friends of the Earth in Washington, D.C., said no more for SETI.

"The idea and ideal of being told that we can't afford to save this planet but we do have enough money to listen to aliens on other planets is just absurd," said Dr.

Project Phoenix 1998-2004

SETI Institute (- minus NASA \$\$)

Private Funding (Packard of HP)

Relocated to Australia 64 - m telescope

Used various other telescopes, including Arecibo

1.2 - 3.0 GHz , 28×10^6 channels, 1 Hz channel width

Targeted search: 850 nearby stars within 240 ly

Sensitivity $\sim 1 \times 10^{-26} \text{ W m}^{-2}$

Could detect 1 Mega Watt if beamed to us by similar size telescope

Used a second telescope to discriminate against interference

No civilizations found

Amateur Projects

BAMBI (Bob and Mike's Big Investment)

3.7 - 4.2 GHz Sky survey

1997-1999, but may still be going

SETI League project ARGUS

Use Satellite TV Dishes

1.4 - 1.7 GHz Channel width: 1 Hz

Sens. $\sim 1 \times 10^{-21} \text{ W m}^{-2}$

About 100 sites in 2000

Aim for continuous sky coverage

Current status?

Allen Telescope Array (ATA)

SETI Institute, UC Berkeley

Major telescope dedicated to SETI

Partially constructed, some operations (2006)

Cost $\sim 26 \text{ M \$}$ $\sim 1/2$ provided by Paul Allen, Nathan Myrvoild (Microsoft)

Hat Creek, California $350 \times 6 \text{ m}$ antennas

1 - 10 GHz

Began operation with 42 telescopes in Oct. 2007

Goals for Allen Telescope Array

Survey 1,000,000 stars for non-natural extraterrestrial signals with enough sensitivity to detect the equivalent power of the Arecibo radar out to 1000 light-years within the frequency range of 1 to 10 GHz

Survey the 4×10^{10} stars of the inner Galactic Plane in the "water hole" frequency range from 1420 MHz to 1720 MHz for very powerful, non-natural transmitters

They need funding for more antennas.

Expanding the Search Radius

Comparison of the Allen Telescope Array and Project Phoenix

Searches with Visible Light

For pulsed signals, visible light from lasers.
Some advantages. Can concentrate light in narrow band, short pulses to distinguish from star light.
They have to be beamed toward us.

Optical SETI at Harvard: 1.5-m telescope
 $4 \times 10^{-9} \text{ W m}^{-2}$ in nanosecond pulses
Plan to observe 13000 stars. Also a northern sky survey.

Optical SETI in California 1-m telescope
Multiple detectors to avoid false signals.
