March 7, 2011

Exams back, key posted on Wednesday

Reading: Chapter 7, Chapter 8 - Sections 8.1, 8.2, 8.5, 8.6, 8.10

Astronomy in the news? Wheeler in Russian

Pic of the day: video of giant solar prominance, close cousin of magnetic jet.

Goal:

To understand the nature and importance of SN 1987A for our understanding of massive star evolution and iron core collapse.

Rob McNaught patrol photos - the day before

2-22-87

The first known photo of SN 1987A hours after shock breakout

2-23-87

One day later

2-24-87

Near maximum light

5-20-87

About when I saw it

8-23-87

One Minute Exam

When SN 1987A exploded, where would have been a good place to have seen it with your naked eye?

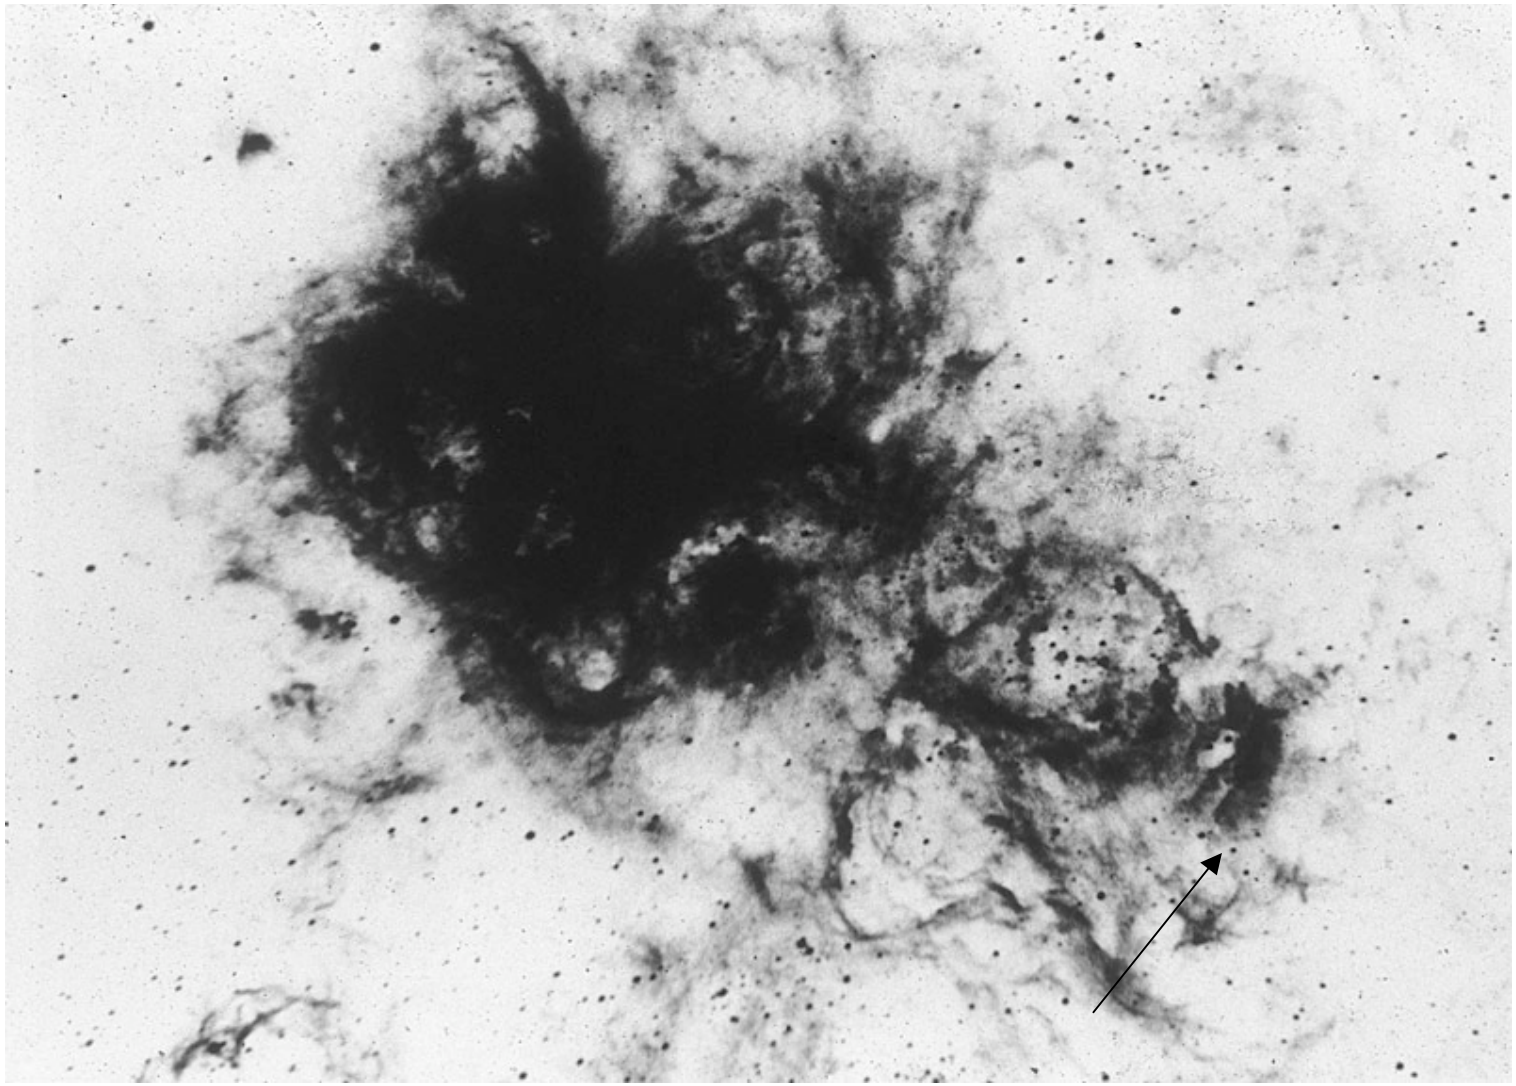
 Texas

 Japan

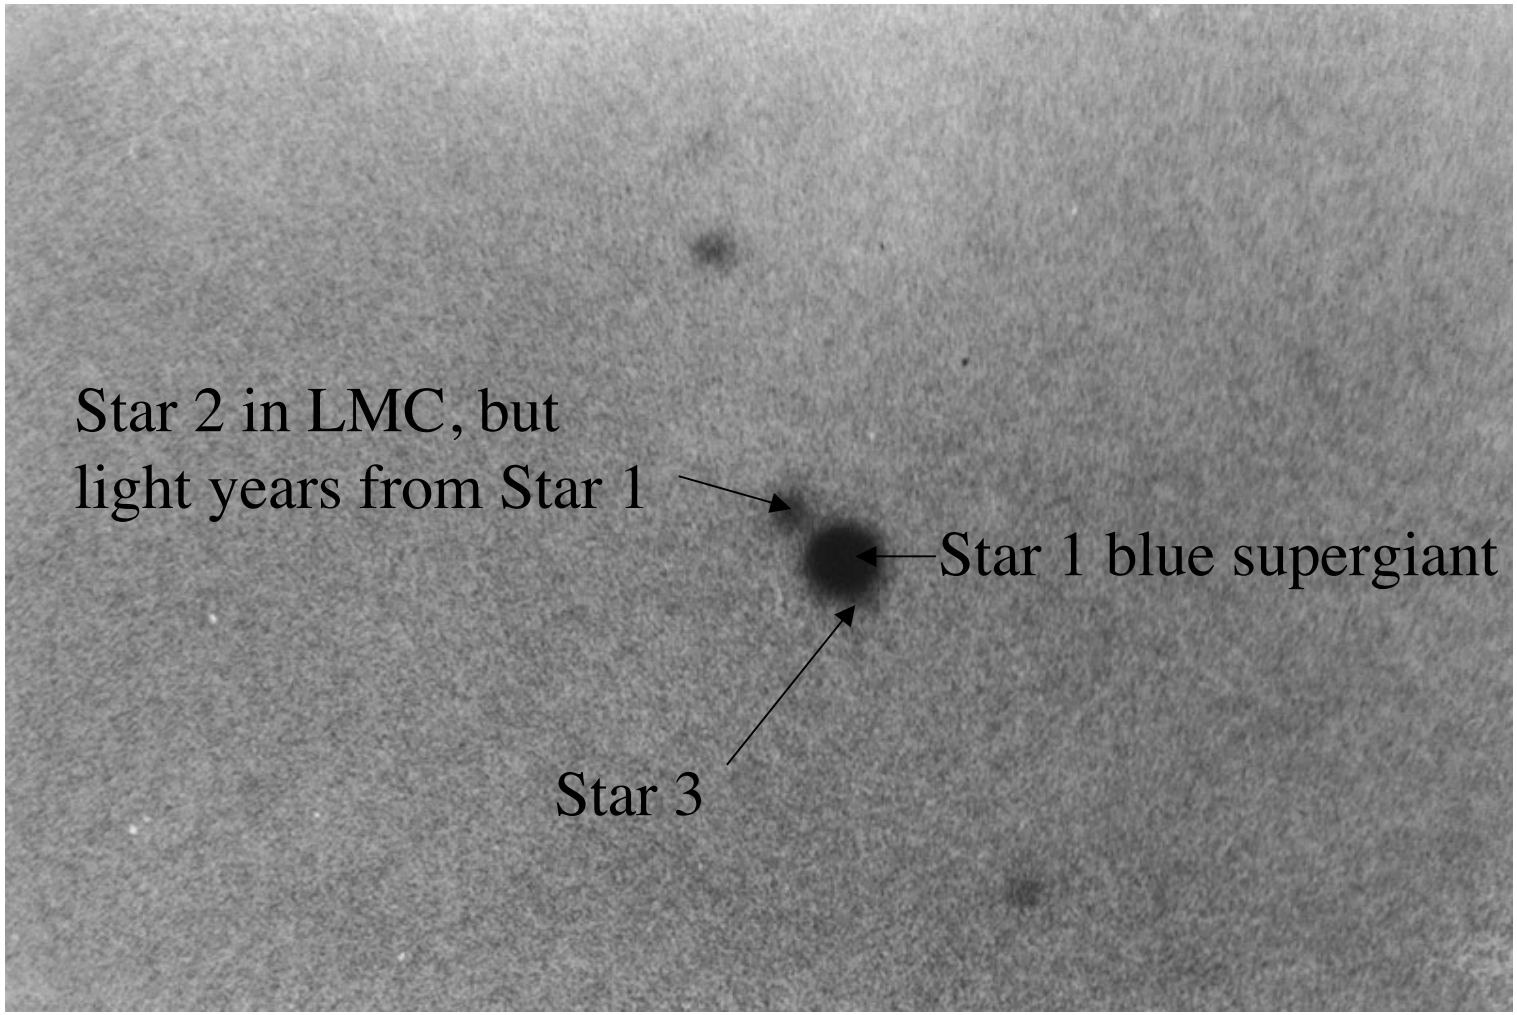
 Russia

 Argentina

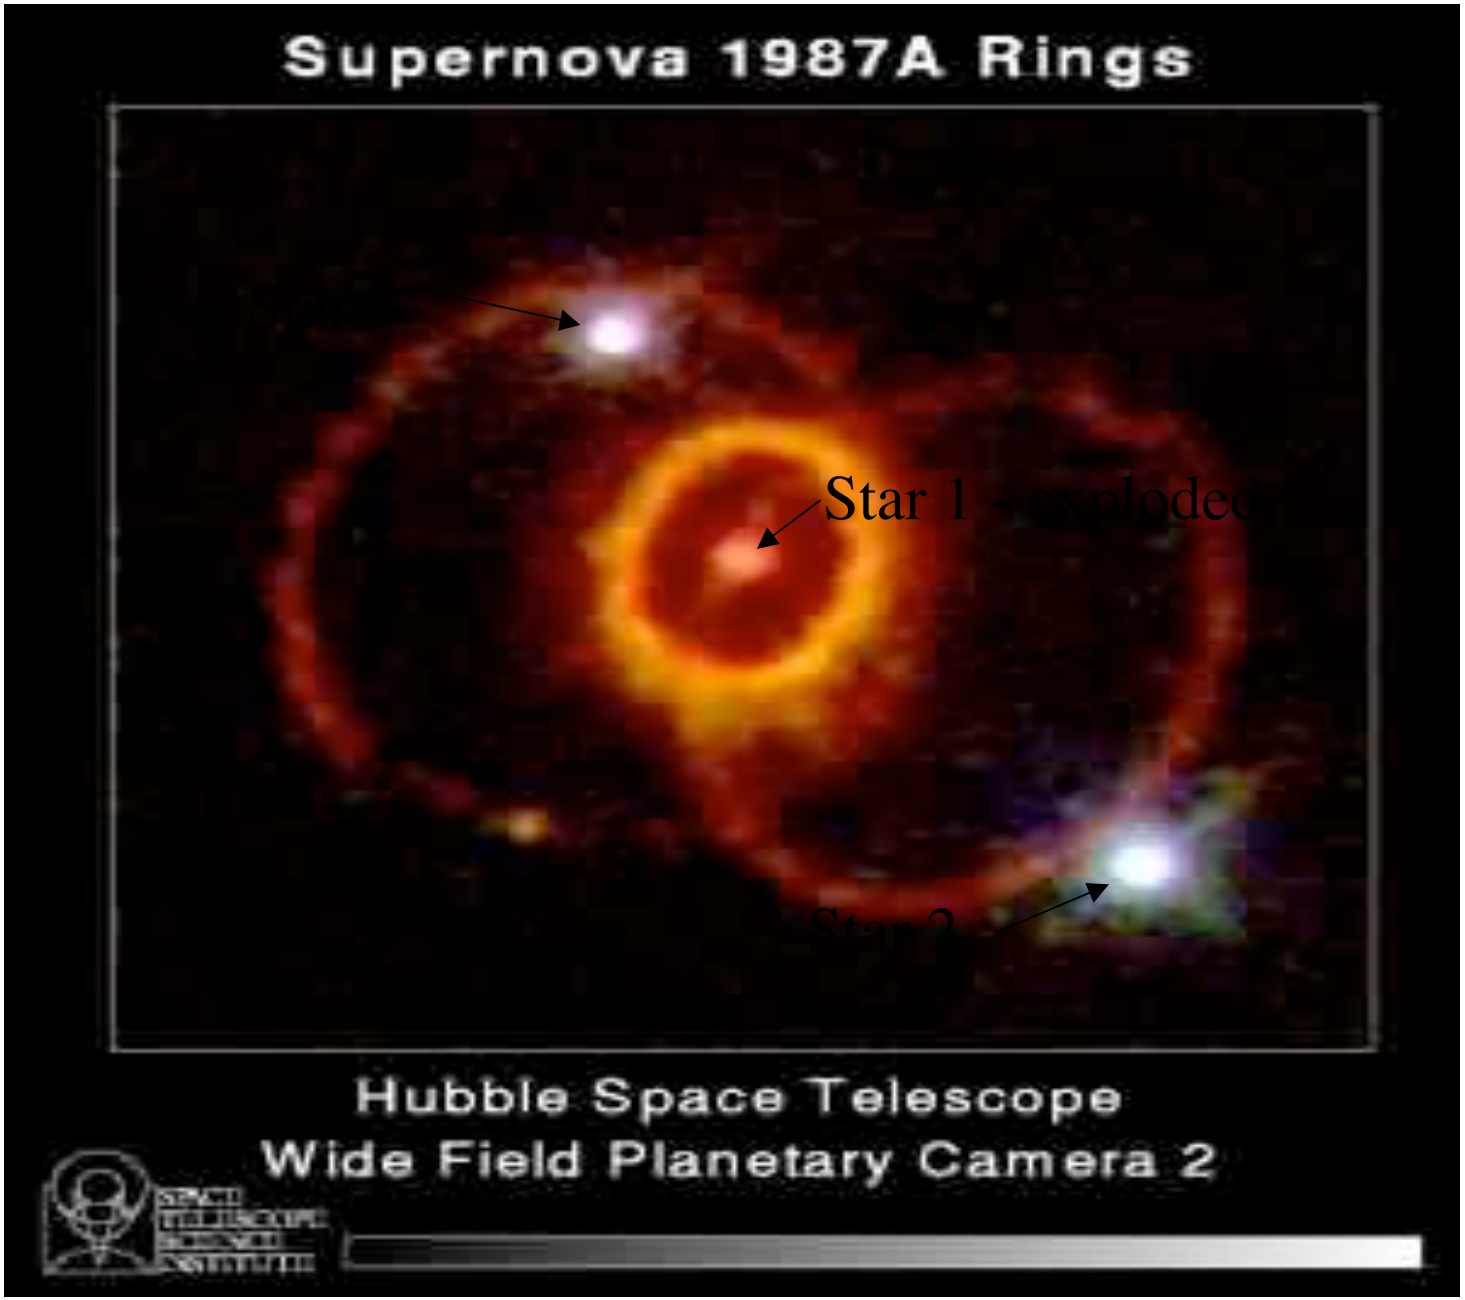
Photo of progenitor star (giraffe)



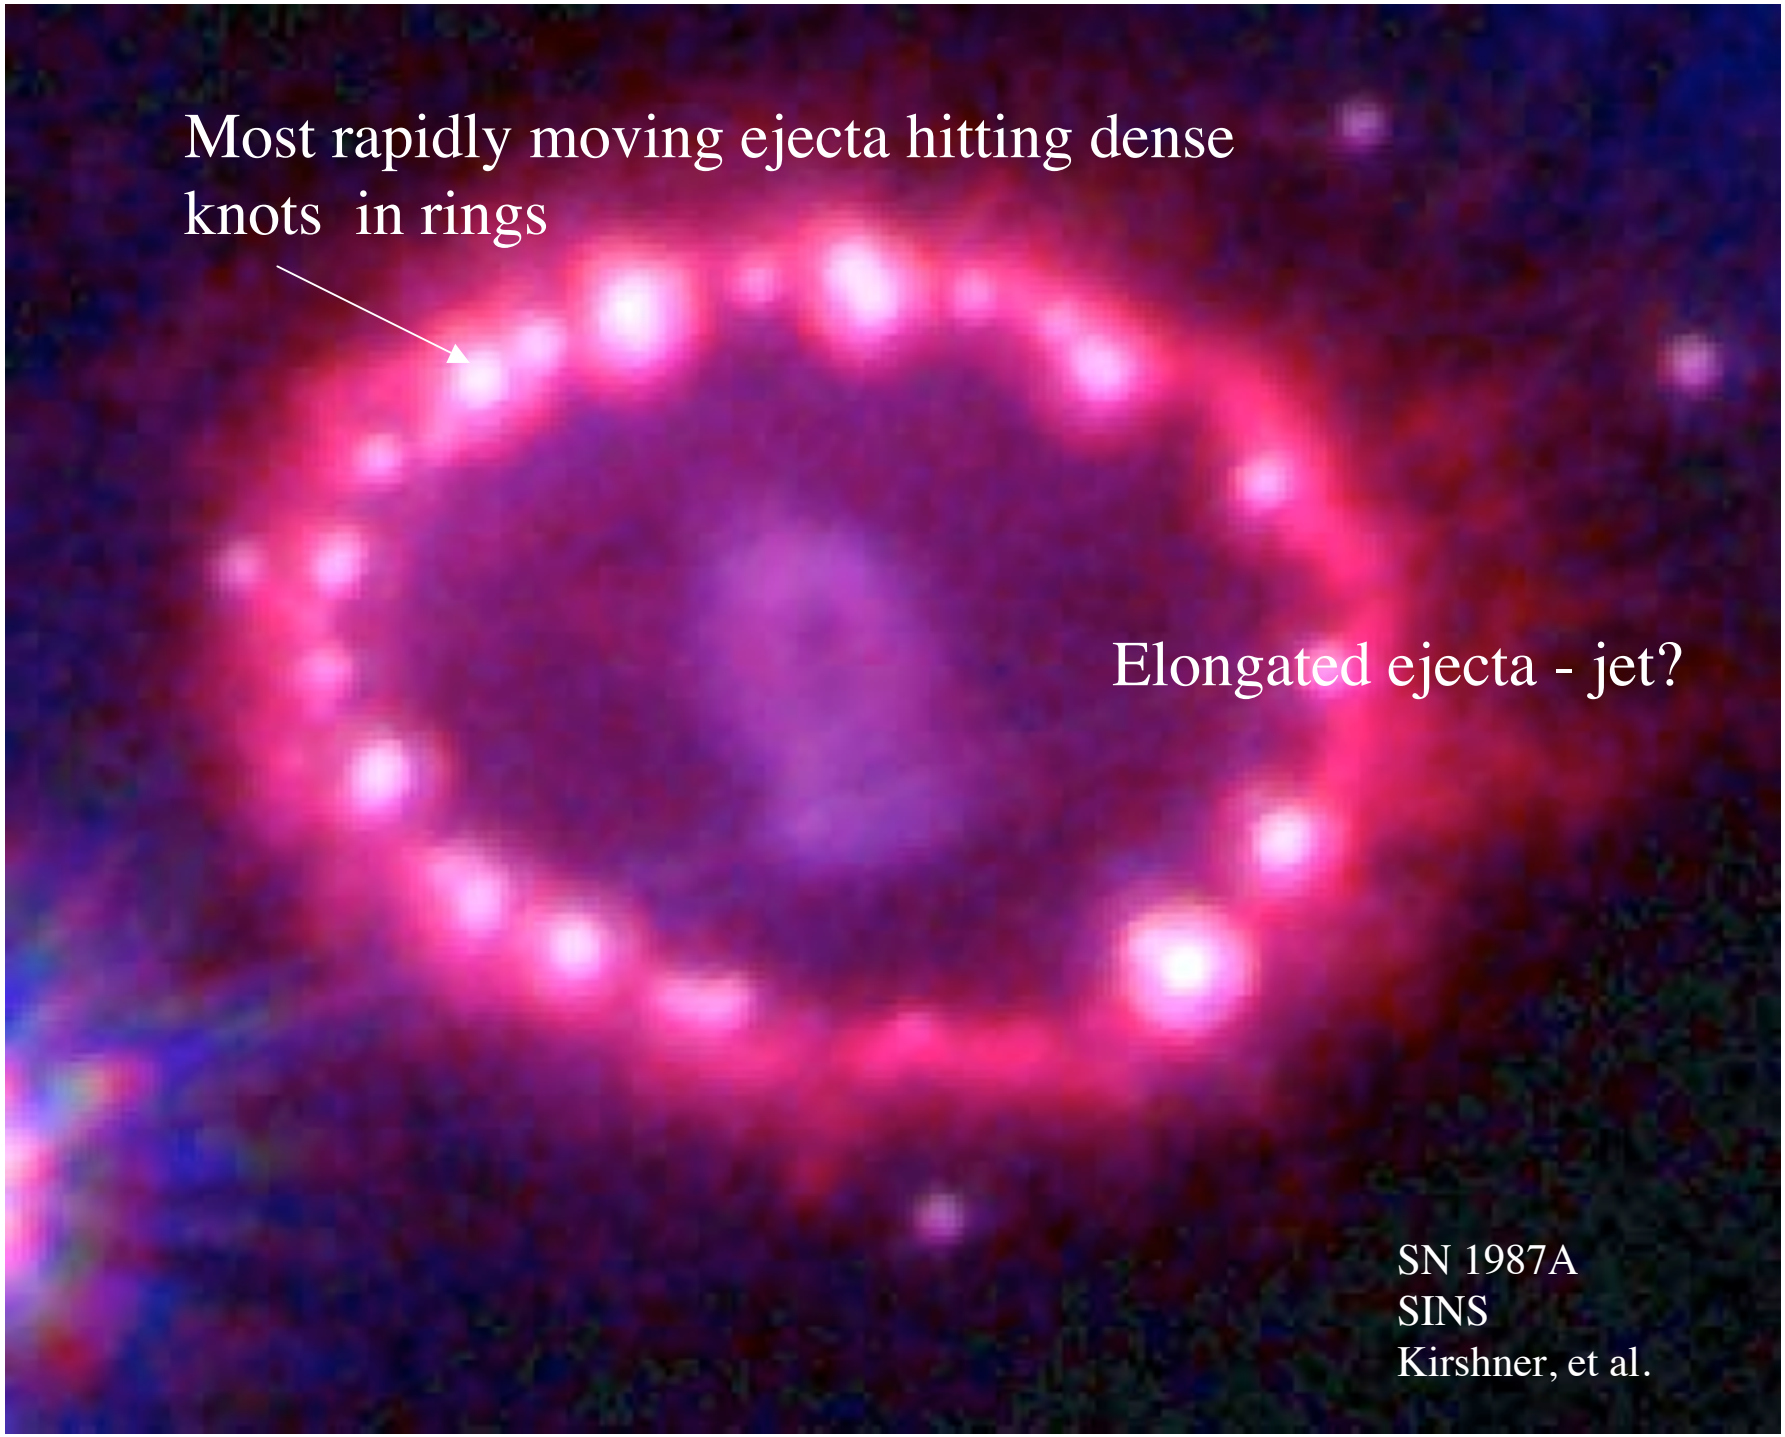
Stars 1, 2, 3



Close-up

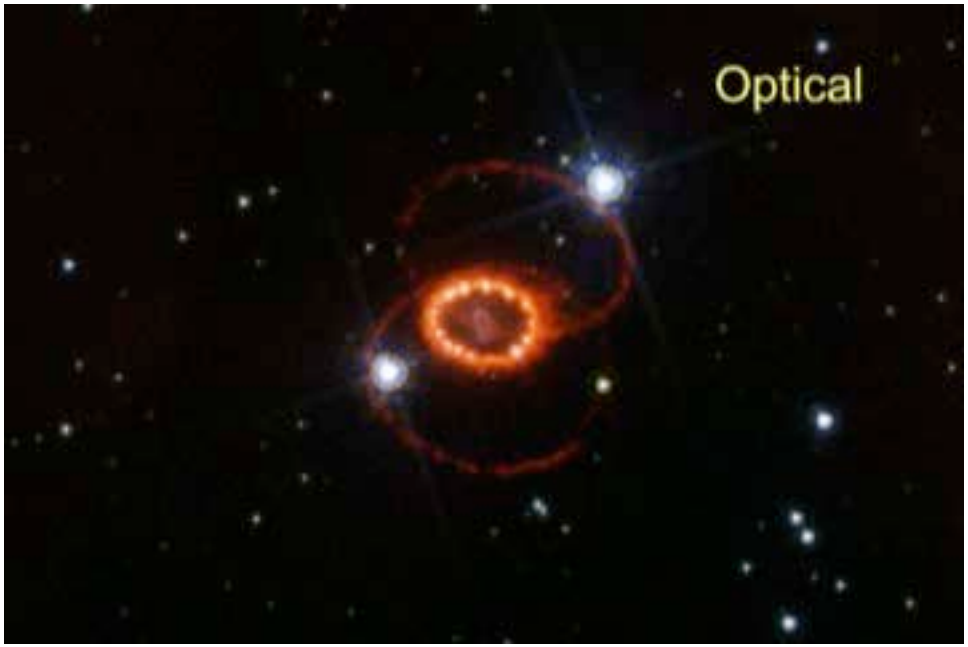


Supernova 1987A Rings
Star 1 - exploded
Star 2
Hubble Space Telescope
Wide Field Planetary Camera 2



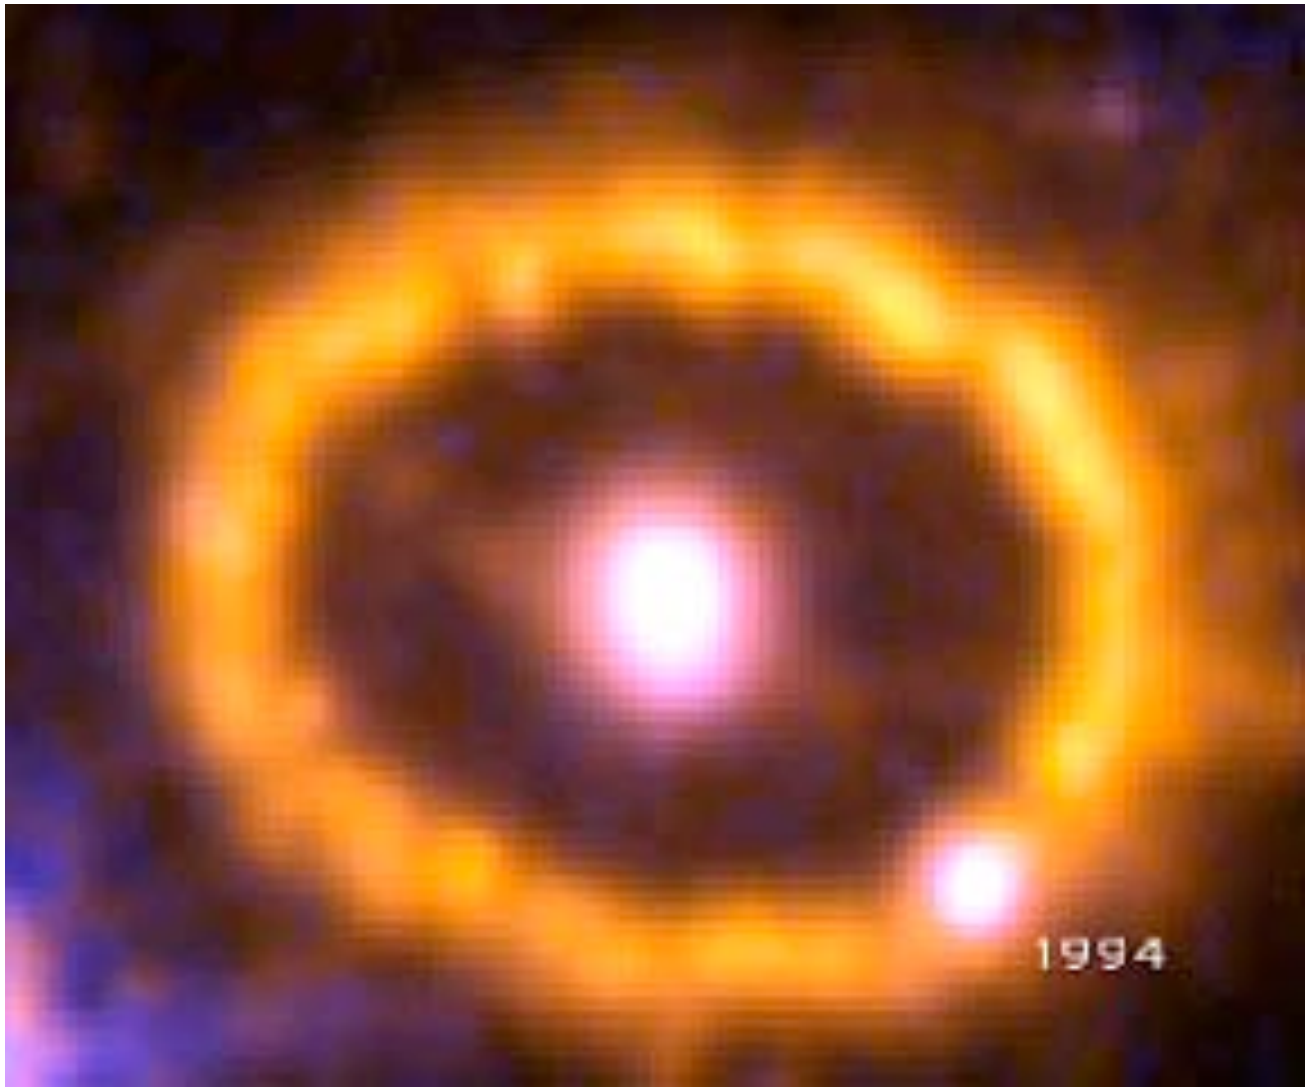
Most rapidly moving ejecta hitting dense knots in rings
Elongated ejecta - jet?
SN 1987A
SINS
Kirshner, et al.

1994

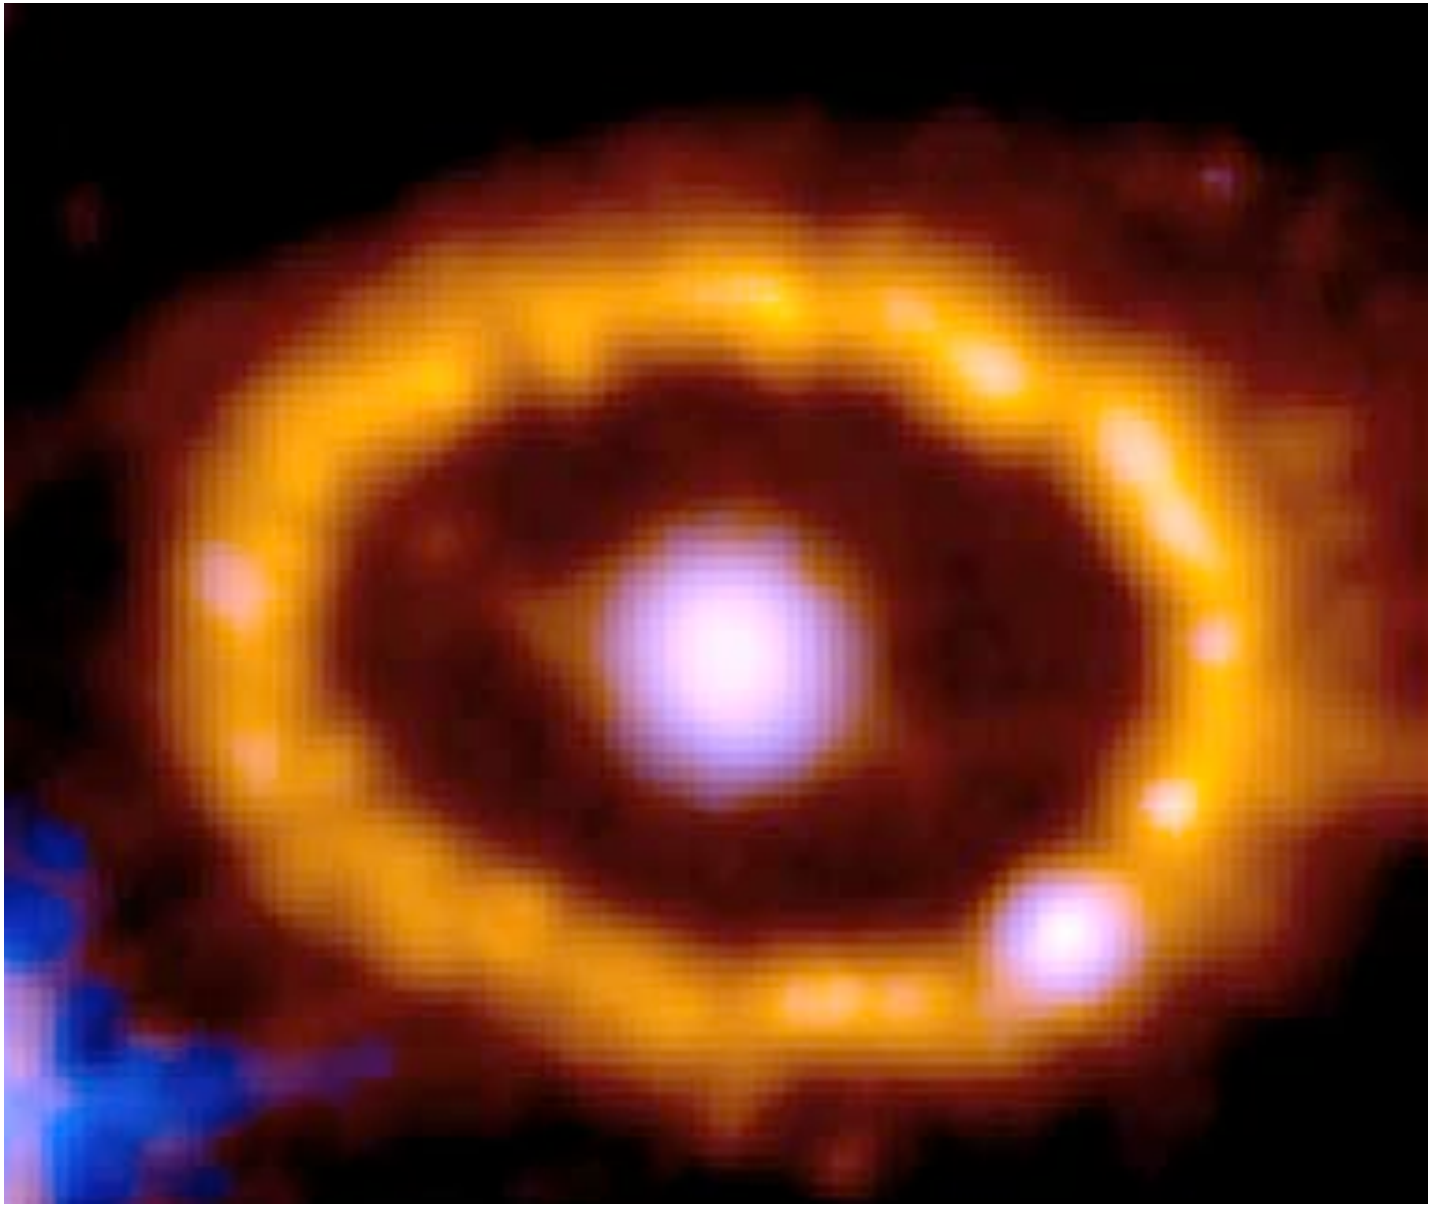


Optical

Movie of Hubble data 1994 - 2006



Updated to 2010



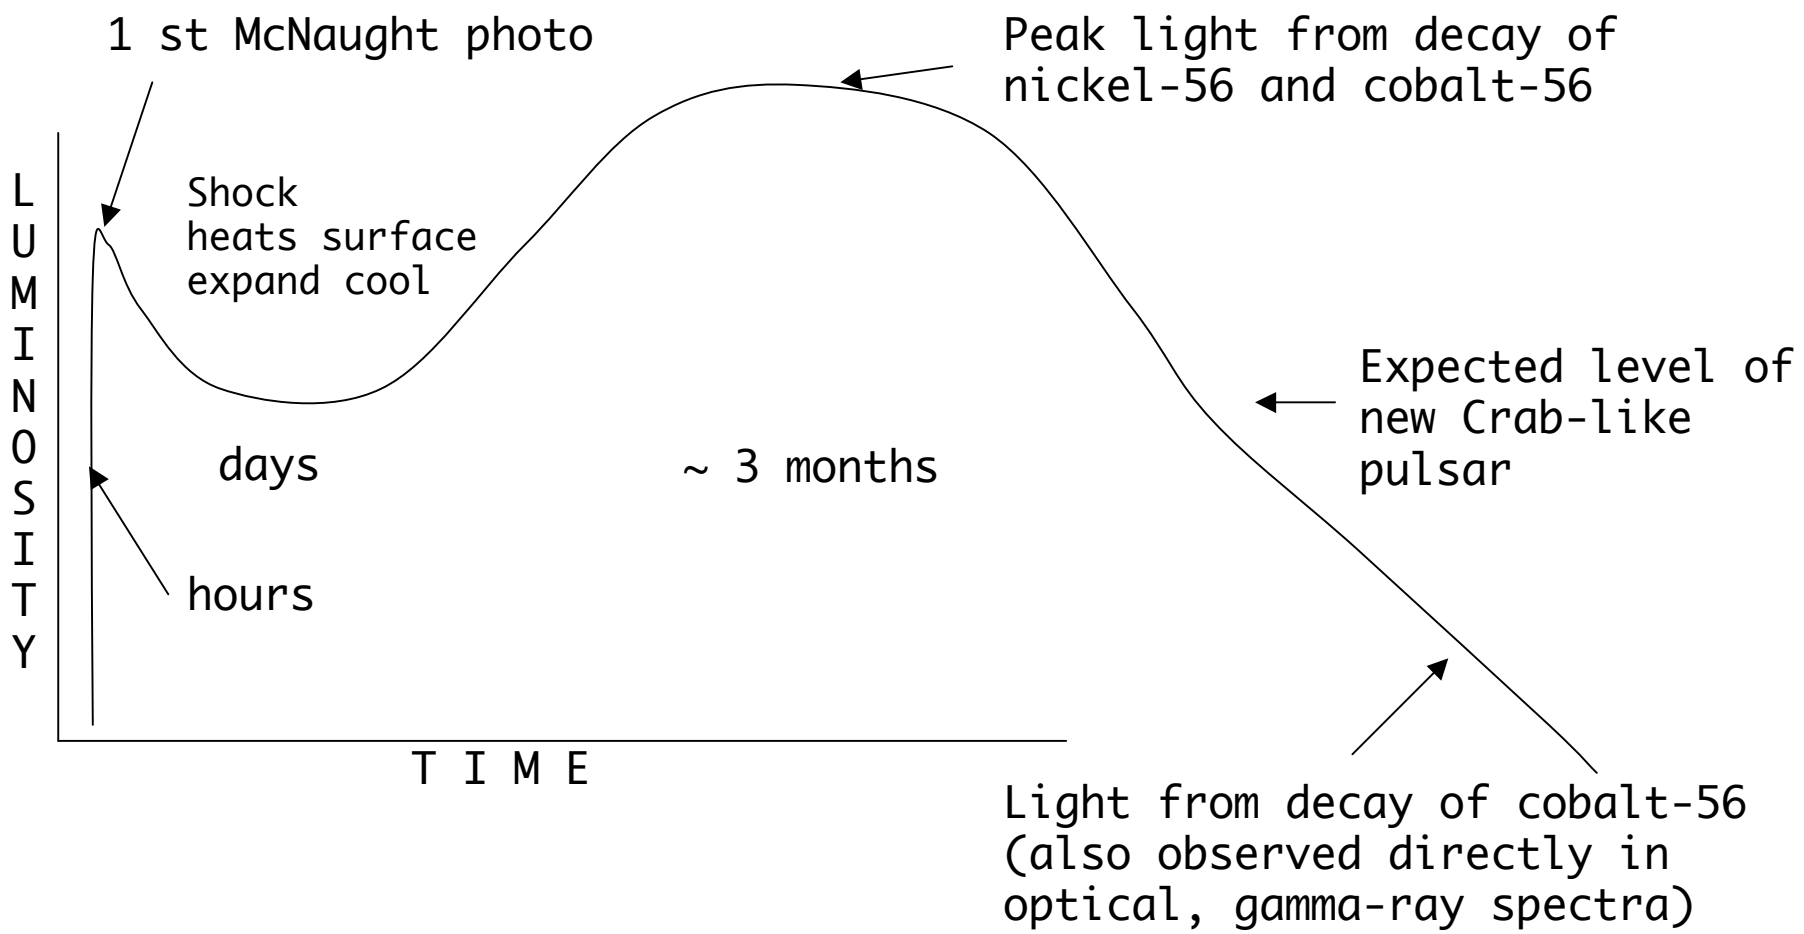
The single most important thing about SN 1987A is that we detected the neutrinos!

It was definitely a core-collapse event

10^{57} neutrinos emitted, most missed the Earth. Of those that hit the Earth, most passed though since neutrinos scarcely interact.

About 19 neutrinos were detected in a 10 second burst.

170,000 year history!



SN 1987A had a rather peculiar light curve because it was a relatively compact blue supergiant, not a red supergiant, brief shock heating, rapid cooling by expansion, no plateau, subsequent light all from radioactive decay

One Minute Exam

What was the most important thing about SN 1987A in terms of the basic physics of core collapse?

 It exploded in a blue, not a red supergiant

 It was surrounded by a ring

 It produced radioactive nickel and cobalt

 Neutrinos were detected from it
