The Origin of Intelligence

The Origin of Intelligence

f_i : Fraction of life-bearing planets where
Intelligence develops

What is intelligence?
Propose: "The ability to model the world,
including the organism itself"

$\Rightarrow$ Intelligence as continuum
        related to complexity of organism
        milestone: human-level intelligence

Information as Measure of Intelligence

Evolution of intelligence $\sim$ increase in information

DNA: model of organism, the program

A quantitative measure: # of bits of information

Bit: Information in the answer to a yes/no question

e.g.,

Purines	Pyrimidines
Adenine (A)	Cytosine (C)
Guanine (G)	Thymine (T)

Information Content

Unit	# of Bits	# of Pages	# of Books
1 base	2		
1 codon	6		
Virus	$\sim 10^3$	1	
Bacterium	10^6	1000	
Amoeba	5×10^8		500
H. Sapiens*	6×10^9		small library

*~ 2% codes for proteins
$\Rightarrow$ 1.2×10^8 bits

Figure 7.18. Length of DNA molecules. Note that the DNA of some plants and amphibians is longer than that of bacteria by a factor of 10⁴ to 10⁵. The total length of human DNA is approximately 10^6 μm or 1 m, which is equivalent to roughly 3×10^9 nucleotide pairs or 10^9 codons. Obviously, the length of DNA carried by an organism is not necessarily related to its phenotypic complexity. We may conclude that DNA does not carry useful information over its entire length. Much of its coding is "nonsense." (Adapted from Alberts, et al. 1983, 405, 530.)

Evolution produced Increase in information

Information stored in DNA limited by fidelity of Replication. The bigger the genome, the smaller the mutation rate must be.
Gago et al. 2009, Science, 323, 1308
Based on Sagan
Dragons of Eden

Why Brains?

To get more than 10^{10} bits (or 10^8?), need extra-genetic storage

Neurons led to brains

How is information stored in brains?

Not entirely clear

Neuron fires or not: 1 bit/neuron

          Yes or No

Neurons are the building blocks

From slice of life project

Neuron has many inputs from dendrites.
Some favor firing, some inhibit firing.
Based on balance, the neuron fires (or not).
Electrical signal travels along axon (output).
Releases neurotransmitters in synapse.
They affect another neuron.

Further complication: reverse signalling.
Receiving neuron can release chemicals that inhibit the neurons that sent "don't fire" signals. Involved in learning.

Brains are Different

Neuron firing controlled by many (~10^3) inputs - synapses

An **analog** computer $\Rightarrow$ Hard to count

~ 10^{11} neurons, 10^{14} synapses

Corresponds to 20×10^6 books = NY public library

Surrogate Measure:

Brain size or Brain mass/body mass

C. Sagan,
Dragons of Eden

Brain organization

Brain is reprogrammable, unlike genes
$\Rightarrow$ **Individual** can learn

Two hemispheres
Many functions parallel, but some specialized
Many ways to divide brain
Layered brain: reptilian brain
   limbic system (mammals)
                   cortex
Brain size has increased (in some species) with time

$\overset{?}{\Rightarrow}$ Evolution favors higher intelligence (sometimes)

Limbic System

The Cortex

Human Evolution

Phylum: chordata - vertebrates - bilateral symmetry

~ 500 Myr ago

Class: mammals - arose in Triassic period

~ 225 Myr ago

Proliferated and "radiated" at end of cretaceous

(66 Myr ago) after extinction of dinosaurs

Giant asteroid impact at that time

Order: primates - late cretaceous ~ 80 Myr ago

Pikaia (from Burgess Shale)

Primate Characteristics
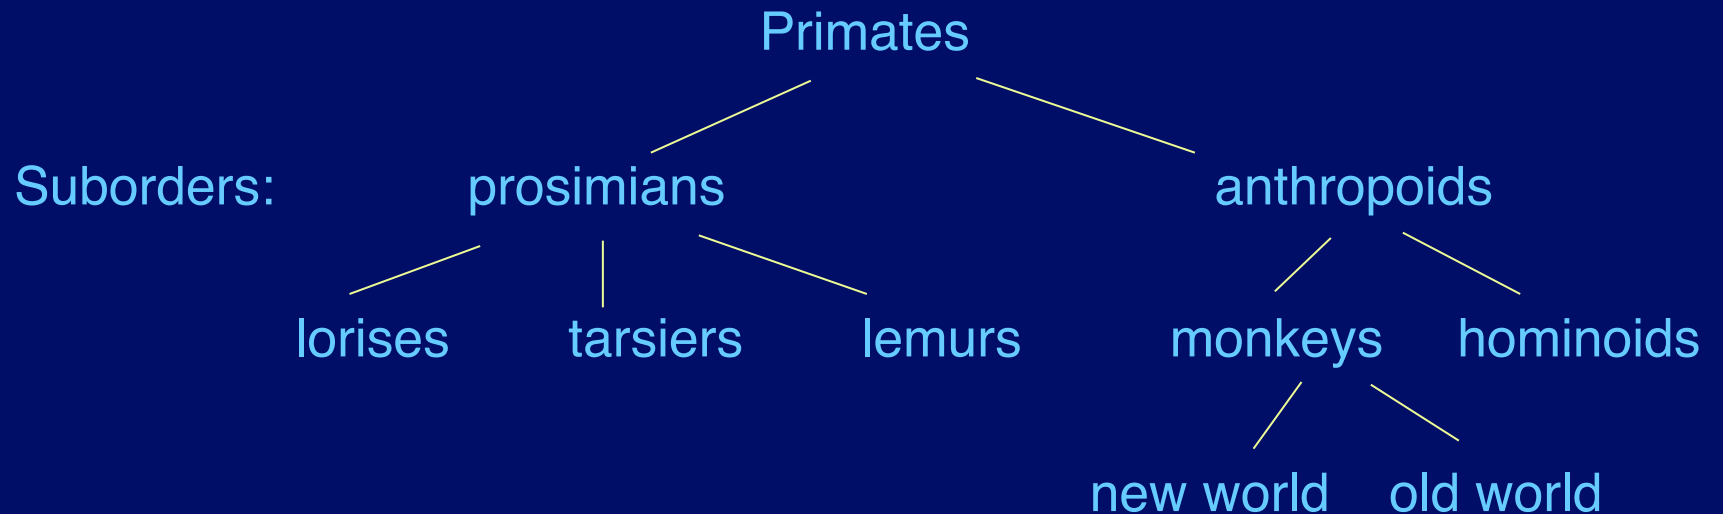

Few anatomical specializations
Flat fingernails, eyes in front
Adapted to life in trees

Primates

Suborders: prosimians   anthropoids

lorises   tarsiers   lemurs   monkeys   hominoids

new world   old world

The Hominoids

				Taxonomic Rank
Hominoidea				Superfamily
Hominidae	15-20 Myr	Hylobatidae		Family
Homininae	14 Myr	Ponginae		Subfamily
Hominini	8 Myr	Gorillini		Tribe
Homo	Pan	Gorilla	Pongo	Hylobates	Genus
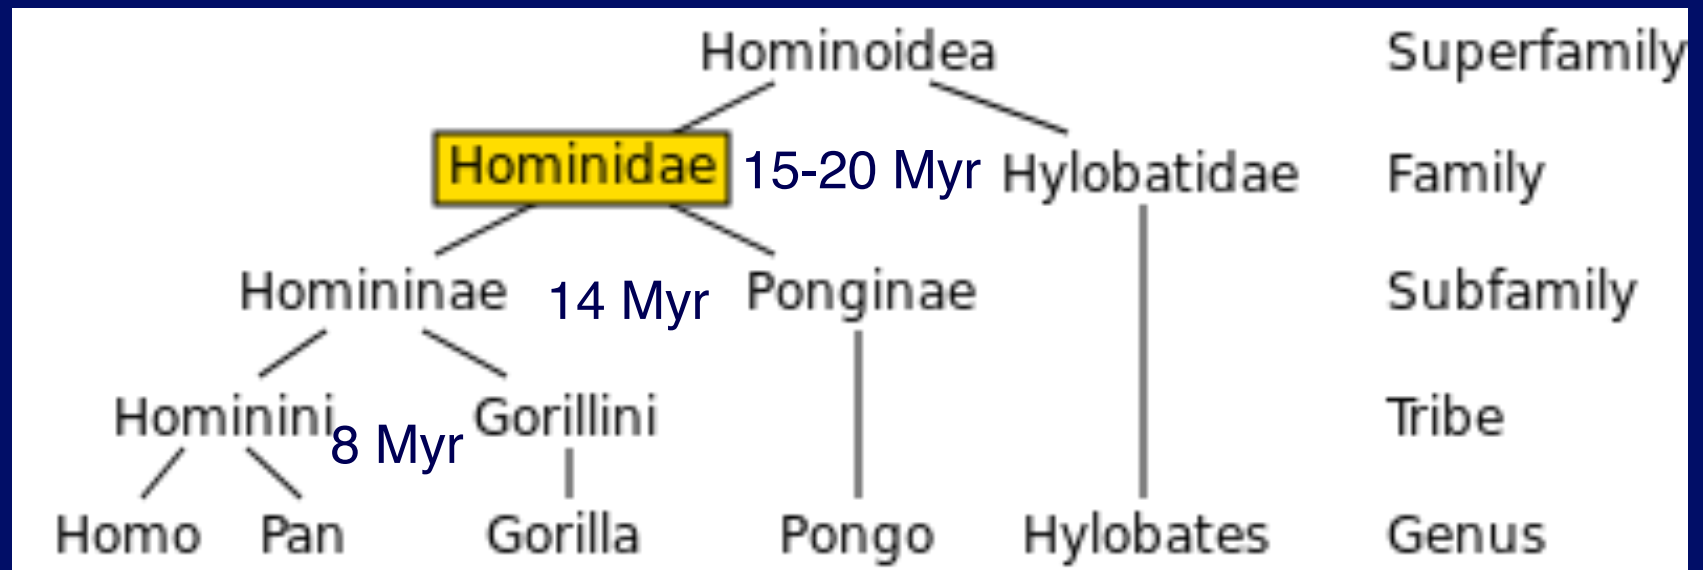

"Recent" fossil record

Cenozoic Era (recent life)
Divided into Tertiary (3rd stage) and
Quaternary (4th stage) Periods

Tertiary further divided into 5 epochs:
dates (in million years ago) are rough.

Era	Period	Epoch	Time at beginning (Myr ago)	Events, Fossils of Note
Cenozoic		Recent	~12,000 yrs	Historical Records Homo sapiens Homo erectus
	Quaternary	Pleistocene	2.5 **2.8**	Homo habilis
			4.2	Australopithecus
			5.5	Ardipithecus
		Pliocene	5.5	Sahelanthropus Gap
		Miocene	23	Ramapithecus Dryopithecine Apes
				Gap
		Oligocene	34	Aegyptopithecus
		Eocene	56	Tarsiers
				Lemurs
	Tertiary	Paleocene	65	Tree Shrews - Primates Proliferation of Mammals Origin of Many Orders
Mesozoic	Cretaceous			

Early Primate Evolution

Adapting to life in trees

    Claws ⟶ nails,   grasp branches

    independent big toe, thumb

Nocturnal ⟶ diurnal

Smell ⟶ vision   stereo vision

                (eyes in front)

Color vision

More complicated information processing

Tool use becomes possible
Origin of Anthropoids

Eocene transition to oligocene   ~ 37 Myr ago
cooler, more grasslands

More diurnal, some leave trees, lose tail

Fayum beds - Egypt   33 Myr ago
Early anthropoid fossil: aegyptopithecus
Used to be considered first hominoid, but now
suspect monkey/ape split was later

Hominid Evolution

Fossils now known back to ~ 7 Myr
Genetic dating of chimp - hominid split 5-7 Myr

Many variations now known

many species co-existed in Africa
Earlier species show mosaic of human-ape traits

Upright walking preceded brain growth, tool making

Comparison of Femurs

Femur adapted to bipedality already by 6 Myr ago

Scientific American Jan. 2003

The last 4.5 Myr of hominid evolution are summarized in the accompanying figure. The solid lines in the figure indicate the lines of descent in a gradualist picture, while the dashed lines indicate the picture of punctuated equilibrium.

New Developments

- Oldest H. habilis fossils found recently: push origin back to 2.8 Myr ago.

More Fossils, more complex picture with many possible species.

Main point: there was a major radiation, but only one species survived.

Were big brains highly selected?
(Did we kill our "cousins"?)
If so, argue for large f_i
Or was it chance that we survived?
If so, argue for small f_i

Our Closest Living Relative

Chimpanzees

H. Sapiens (Darwin)

Humans and Chimpanzees: 1

– Draft of chimp genome released in 2003

– Base substitutions: 1.23% difference

– Gene copies indicate bigger differences

- Up to 6.4% in terms of duplications and losses
- Some seem important in brain development.

– Split from gorillas: 6-7 Myr ago

– Human split from chimp: 5-6 Myr ago

Humans and Chimpanzees: 2

- Paper by Wildman et al. (2003)
  - PNAS, 100, 7181
- Wildman et al.'s "modest proposal"
  - Family Hominidae includes all extant apes
  - Genus Homo includes chimps
  - "We humans appear as only slightly remodeled chimpanzee-like apes."

Humans and Chimpanzees: 3

- On the other hand…
- Cargill et al. (2003) Science, 302, 1960
- Studied what genes evolved fast
  - Chimps: fast changes in skeleton, skin
  - Humans: smell, hearing, speech, digestion
    - Adaptation to consuming more meat

Humans and Chimpanzees: 4

- J. Zhang 2003 in Genetics, 165, 2063
  - Rapid evolution in ASPM gene
    - Mutations in this gene cause microcephaly
    - Brain about size of Australopithicus
    - So important for brain size
  - Rapid evolution in primates
  - Especially in line leading to humans
    - 15 changes since human-chimp split
    - May explain factor of 3 increase in size

More Developments

- Several other genes involved in brain growth
  - Evidence for rapid evolution
  - Some may have evolved as recently as 6000 years ago (update on ASPM gene)
- Differences in brain microstructure
  - Special (fast) neurons (VENS) in apes
  - Humans have many more
  - Some large whales also have VENS

  (brain story in Science 2007, 315, 1208)

The Last Steps to Modern H. sapiens

Origin of Modern H. Sapiens

Many anthropologists now believe that
H. erectus were replaced by a new wave
"out of Africa" ~ 100,000 yrs ago.
Alternative: Multiregional model
Separate groups of H. erectus leading to
H. Sapiens (looks less likely)

Evidence: Genetic, linguistic, fossil

Two Models

Out of Africa

Europe   Africa   Asia

Anatomically modern *H. sapiens* evolves in Africa and then spreads to Europe and Asia.

H. erectus disperses from Africa.

Out of Africa model

Multiregional

Europe   Africa   Asia

Anatomically modern *H. sapiens* genes arise in many populations.

H. erectus disperses from Africa.

Multiregional model
Genetic: humans are **very** homogeneous
greatest diversity is in Africa

$\Rightarrow$ 	Evolved in Africa, population bottleneck

	a small group left Africa, spread over Earth

Linguistic: Good correlation of linguistic family

tree with genetic one

Fossil: Oldest fossils of modern H. sapiens are

found in Africa

Neanderthals and Us

- In 2009, analysis of DNA from Neanderthals
  - Science 13 February 2009:
    Vol. 323. no. 5916, pp. 866 - 871
    - 38,000 yr old fossils from cave in Croatia
    - Some evidence of inter-breeding with modern H. sapiens outside of Africa
    - 1-4% of modern human DNA may be from Neanderthals

Questions

1. What **selected** for the increase in brain size over the last 6 Myr?

    - Adaptation to climate changes?

    - Cooperation and language (large-animal hunting)?

    - Intergroup conflict?

2. What **limited** the increase?

    - Size of birth canal (bipedalism **decreases** size)
    - Birth when less developed, so more care needed
    - Consequences of need for more care
        - pair bonding, more parental care available
        - slower development led to greater intelligence?

3. How intelligent are other species?

(Chimpanzees, gorillas, … dolphins, whales)
Recent evidence for weapon construction and use by Chimpanzees.

- What features of H. sapiens would we

expect in ETI?

Bilateral symmetry, bear young alive, bipedal, opposable thumb, …

$$f_i = ?$$

Contingency

Does evolution produce greater complexity?
What would happen if we replayed the tape with random
   changes?

Stephen J. Gould   vs.   Conway Morris

Contingency   vs.   convergent evolution

Extinction of   Other precursors
Early Chordata
    ↓   ↓

No intelligence   intelligence in
                       other shapes

Who is Right?

- Can't rewind the tape for macroevolution
- But remember the E. Coli 25 year experiment?
- Some samples were frozen every 75 days (500 generations)
- Could thaw out and rerun (bacteria survive freezing)
- 4 out of 72 developed citrate use
- Sometimes the rewind produces the same result!

Estimating f_i

1. Galactic habitable zone (GHZ)
     Gonzales, Ward, Brownlee
     and Ward and Brownlee in *Rare Earth*

   Complex life requires more benign conditions
   more stars closer to center of galaxy (stars
   closer together) Supernovae, X-rays, Gamma-rays
   could extinct complex life

   If "animal" life has to avoid inner galaxy, this would
   decrease f_i

2. Timescales

Time to evolve human-level intelligence

~ 1/2 lifetime of stars like Sun

$\Rightarrow$ rule out much more massive stars

(already done in n_e)

~ 1/2 lifetime of galaxy so far

? $\Rightarrow$ intelligent life is rare

Brandon Carter

? Statistics of <u>one</u> are suspect

Summary

- Values for f_i can range from very small (e.g., 10^{-6}) to 1
- Consider contingency vs. convergence
- Need for stable conditions
- The particular evolution that led to H. sapiens
- Consider other ways to get to intelligence
- Other species on Earth that may be very intelligent
